# ENVIRONMENTAL AND SOCIAL IMPACT ASSESSMENT (ESIA) OF THE PROPOSED CHALLAWA GORGE DAM WATERSHED MANAGEMENT PROJECT

Submitted to

## HADEJIA JAMA'ARE KOMADUGU YOBE BASIN-TRUST FUND

JULY 2021

### **DRAFT FINAL REPORT**

## Report No.: HJKYB-TF. ProfAB 003

### GRANT No.:5600155001401

### Client: Hadejia Jama'are Kumadugu Yobe Basin-Trust Fund

### Date of Report: AUGUST 2021.

Client: Hadejia Jama'are Komadugu Yobe Basin-Trust Fund

#### Date of Report: September 2021.

Project ESIA Consultant: PROFESSOR ABBAS BASHIR

|             | Name               | Function             | Signature | Date              |

# **CHAPTER ONE:**

## **1.0 INTRODUCTION**

| 1.1 Background  | 1 |
|---|---|
| 1.2 Project Proponent   | 2 |
| 1.3 Purpose of ESIA Report  | 2 |
| 1.4 Objective of the Environmental and Social Impact Assessment               | 2 |
| 1.5 Scope of the ESIA/ESMP Study  | 5 |
| 1.6 Justification for the project   | 5 |
| 1.7 Summary of the key activities undertaken in line with the ESIA Procedures |   |
| In Nigeria  | 5 |
| 1.8 ESIA Report structure   | 7 |

# **CHAPTER TWO:**

## 2.0 POLICY, LEGAL AND ADMINISTRATIVE FRAMEWORK

| 2.1 National (country) Laws and Legislations and guiding principle         | 8  |
|--|----|
| 2.2 The African Development Bank (AFDB) Requirements and guiding Principle | 14 |
| 2.2.1 The Integrated Safeguards Sustem (ISS)                               | 14 |
| 2.2.2 The Integrated Safeguards Policy Statement                           | 15 |

| 2.2.3 The Operational Safeguards (OSs)  | 15             |
|---|----------------|
| 2.2.4 Environmental and Social Assessment Procedures  | 17             |
| 2.3 State Laws and Legislations   | 18             |
| 2.4 AFDB Project categorizations process  | 19             |
| 2.5 International Protocols and Agreements on water and Sustainable Environment   | 21             |
| 2.6 Institutional Framework   | 22             |
| 2.61 Federal Ministry of Water Resources (FMWR)   | 26             |
| 2.6.2 Federal Ministry of Environment   | 27             |
| 2.6.3 HJKY Basin Trust Fund (HKJYB-TF)<br>2.6.4 The Hadejia–Jama'are River Basin Development Authority<br>2.6.5 State Level | 31<br>32<br>33 |
| 2.7 Chad Basin Development Authority  | 34             |
| 2.8 The African Development Bank (AFDB)   | 34             |
| 2.9 Policy Issues and constitutional Gaps in the komadugu Yobe Basin  | 35             |
| 2.9.2 Policy Issues   | 35             |
| 2.9.3 Institutional Gaps  | 36             |
| 2.9.4 Institutional Gaps  | 36             |

# **CHAPTER THREE:**

## **3.0 PROJECT JUSTIFICATION AND ALTERNATIVES**

| 3.1 Introduction                                       | 38 |
|--|----|
| 3.2 Justification for the Project                      | 38 |
| 3.2.1 The Qatershed Management Project                 | 38 |
| 3.2.2 The Challawa Gorge Watershed Degradation Problem | 38 |
| 3.2.3 Challawa Water Treatment Plant Siltation         | 41 |

| 3.3 Potential Benefits and Beneficiaries of the Project    | 42 |
|--|----|
| 3.3.1 Environmental Benefits                               | 42 |
| 3.3.2 Potential Beneficiaries                              | 44 |
| 3.3.3 Biodiversity Benefits, Protection and Restoration    | 44 |
| 3.3.4 Potential Beneficiaries                              | 44 |
| 3.3.5 Socioeconomic Benefits                               | 44 |
| 3.3.6 Beneficiaries  | 45 |
| 3.4 Project Sustainability                                 | 45 |
| 3.4.1 Technical Sustainability                             | 45 |
| 3.4.2 Economic Sustainability                              | 46 |
| 3.4.3 Social Sustainability                                | 51 |
| 3.4.4 Environmental Sustainability                         | 51 |
| 3.5 Analysis of Project Alternatives                       | 52 |
| 3.5.3 Particpatory Watershed Management Option             | 65 |
| 3.5.3.1 The Main Benefits of the Particpatory Alternatives | 65 |
| 3.5.3.2 Disadvantages                                      | 65 |
| 3.5.4 Rainwater Harvesting                                 | 66 |
| 3.5.4.1 Adaptive Watershed Management Option               | 66 |
| 3.5.5 Reservoir Dredging Option                            | 67 |
| 3.6 Public views and concerns of the Alternatives          | 67 |

# **CHAPTER FOUR**

## 4.0 PROJECT DESCRIPTION

|  | Page <b>v</b> of <b>490</b> |
|--|-----------------------------|
| 4.2 Project Location                               | 71                          |
| 4.1 Background to the Watershed management Project | 69                          |

| 4.3 Objectives of the Challawa Gorge Dam watershed management Project    | 73  |
|--|-----|
| 4.4 The Project Components and Activities                                | 74  |
| 4.4.1 General Site Description of the Project                            | 74  |
| 4.4.2 Project Component 1; Gully Bank Erosion Control                    | 82  |
| 4.4.3 Check Dams Component   | 83  |
| 4.4.4 Stream Bank Stabilisation with Bioremediation                      | 87  |
| 4.4.5 Erosion Control Structures   | 95  |
| 4.4.6 Gully Bank Treatment with Bioremediation and Agricultural Measures | 96  |
| 4.4.7 Riparian Buffer Strip  | 101 |
| 4.4.8 Agricultural Erosion Control Methods Component                     | 107 |
| 4.5 The Project component and Activities                                 | 72  |
| 4.6 Construction Activities  | 112 |
| 4.7 Activity Phase   | 112 |

# **CHAPTER FIVE**

### 5.0 DESCRIPTION OF PROJECT ENVIRONMENT AND BASELINE CONDITIONS

| 5.0 Introduction   | 118 |
|--|-----|
| 5.1 General Overview of conditions of project sites      | 118 |
| 5.2 Area of Project Influence (API)                      | 120 |
| 5.3 Geography and Environmental Settings of the Project  | 122 |
| 5.4 Geography and Environmental settings of the Project  | 126 |
| 5.5 Sampling for physical characteristics study          | 126 |
| 5.6 Air quality and noise studies                        | 128 |
| 5.7 Climatic and Meteorological Condition                | 130 |
| 5.8 Soil   | 131 |
| 5.9 Vegetation Studies                                   | 132 |
| 5.10 Wildlife  | 133 |
| 5.11 Aquatic Studies                                     | 133 |
| 5.12 Design of the socio-economic surface                | 135 |
| 5.13 Land Use  | 137 |
| 5.14 Quality Assurance/Quality Control                   | 137 |
| 5.15 Chain of Samples custody Procedure                  | 141 |
| 5.16 Description of Baseline biophysical Environment     | 141 |
| 5.8 Relief and Drainage                                  | 150 |
| 5.7 Environmental Quality studies                        | 151 |
| 5.8 Geological, Hydrology and geomorphic Characteristics | 157 |
| 5.9 Hydrology of the project location                    | 159 |
| 5.8 Surface water Occurrence                             | 159 |
| 5.2 Soil   | 163 |
|  |     |

| 5.3 Physiochemical Properties of the soils | 164 |
|--|-----|
| 5.4 Result of Soil Analysis                | 166 |
| 5.5 Ground water and surface water quality | 174 |
| 5.8 Fauna Characteristics                  | 186 |
| 5.8 Land Use                               | 188 |
| 5.9 Socio-economic environment             | 192 |

# **CHAPTER SIX**

### 6.0 MITIGATION /ENHANCEMENT MEASURES

| 6.1 Introduction  | 231 |
|---|-----|
| 6.2 Impact Assessment Approach and Methods                  | 233 |
| 6.3 Definition of Impact Terminologies                      | 234 |
| 6.4 Magnitude of Impact                                     | 236 |
| 6.5 Sensitivity of resources and receptors                  | 236 |
| 6.6 Likelihood  | 237 |
| 6.7 Impact Evaluation                                       | 237 |
| 6.8 Overall Significance ranking                            | 240 |
| 6.9 Approach to Mitigation Measures                         | 241 |
| 6.10 Residual Impact Assessment                             | 242 |
| 6.11 Potential Impacts during Initial Preconstruction Phase | 242 |
| 6.11.1 Impacts on Air Quality                               | 242 |
| 6.11.2 Impacts on Ambient Noise Level                       | 243 |
| 6.11.3 Impacts on Soil                                      | 244 |
| 6.11.4 Impacts on Surface and Groundwater                   | 246 |

| 6.11.5 Impact on Vegetation   | 24  |
|---|-----|
| 6.11.6 Impacts on Wildlife  | 248 |
| 6.11.7 Impact on Fisheries and Aquatic Resources                        | 248 |
| 6.11.8 Impacts on Socio-cultural resources                              | 249 |
| 6.12 Socio-economic Mitigation Measures                                 | 251 |
| 6.12.1 Impacts on Demography/Population                                 | 251 |
| 6.12.2 Impacts on Income/Livelihood                                     | 252 |
| 6.12.3 Impacts on Employment and Opportunities                          | 253 |
| 6.12.4 Impact of Community Infrastructure                               | 254 |
| 6.13 Impact and Mitigation Measures During Construction Phase           | 256 |
| 6.13.1 Impacts on Ambient Air Quality                                   | 256 |
| 6.13.2 Impacts on Ambient Noise Level                                   | 257 |
| 6.13.3 Impacts on Soil  | 258 |
| 6.13.4 Impacts on Water Resources                                       | 259 |
| 6.13.5 Impacts on Vegetation  | 260 |
| 6.13.6 Impact on Wildlife during Construction Phase                     | 261 |
| 6.13.7 Impact on Fisheries and Aquatic Resources                        | 262 |
| 6.13.8 Impacts on Community Health and Safety during Construction Phase | 263 |
| 6.13.9 Impacts on Social Infrastructure                                 | 265 |
| 6.13.10 Project Impact on Security                                      | 266 |
| 6.13.11 Impacts on Employment and Opportunities                         | 268 |
| 6.13.12 Visual Impacts  | 269 |
| 6.13.13 Impact on Workplace Health Hazards and Safety                   | 270 |
| 6.14 Operation Phase Impacts and Mitigation Measures                    | 272 |
| 6.14.1 Impact on Ambient Air quality                                    | 272 |
| 6.14.2 Impact on Ambient Noise Level                                    | 274 |
| 6.14.3 Impact on Soil   | 275 |
| 6.15 Impact on Socio-economy  | 276 |
| 6.15.1 Impact on Occupational Hazard and Safety                         | 277 |
| 6.15.2 Impact on Security of installations and Buffer Vegetation        | 278 |
| 6.15.3 Impact on economic trees and grasses used as Buffer              | 280 |
| 6.16 Decommissioning Phase Impacts and Mitigation Measures              | 281 |

# **CHAPTER SEVEN**

### 7.0 ENVIRONMENTAL AND SOCIAL MANAGEMENT PLAN

| 7.1 Introduction   |     | 285 |
|--|-----|-----|
| 7.2 Objective of Environmental and Social Management Plan (ESMP) |     | 286 |
| 7.3 Institutional Framework for Implementation of the ESMP       |     | 286 |
| 7.3.1 Project Proponent (HJKYB-TF)                               |     | 287 |
| 7.3.2 Project Implementation Unit (PIU)                          |     | 287 |
| 7.3.3 The Ministry's HSE Department                              | 288 |     |
| 7.3.4 Regulatory Agencies and other Concerned Authorities        |     | 288 |
| 7.4 Communication  |     | 293 |
| 7.5 Documentation  |     | 294 |
| 7.6 Operational Control Procedures                               |     | 294 |
| 7.6.1 Grievance Mechanisms                                       |     | 295 |
| 7.6.2 Managing Changes to Project Activities                     |     | 295 |
| 7.6.3 Checking and Corrective Actions                            |     | 296 |
| 7.6.4 Monitoring   |     | 296 |
| 7.6.5 Auditing   |     | 297 |
| 7.6.6 Corrective Action  |     | 297 |
| 7.6.7 Reporting  |     | 298 |
| 7.8 Proposed Management Plan                                     |     | 300 |

# **CHAPTER EIGHT**

### 8.0 CONCLUTION AND RECOMMENDATION

| 8.1 Summary and Conclusion | 334 |
|----------------------------|-----|
| 8.2 Recommendation         | 335 |
|                            |     |
| REFERENCES                 | 331 |
| Appendix 1                 | 336 |
| Appendix 2                 | 338 |
| Appendix 3                 | 339 |
| Appendix 4                 | 341 |
| Appendix 5                 | 352 |
| Appendix 6                 | 353 |
| Appendix 7                 | 354 |

#### **EXECUTIVE SUMMARY:**

### ES 1.0 Background

This ESIA Report is a consultancy service commissioned by the Hadejia Jama'are Komadugu Yobe Basin Trust Fund (HJKYB-TF) (the Proponent) as part of requirements to implement its 25 year Strategic Action Plan (2019) with specific reference to Challawa Gorge Dam Watershed Management sub-program out of four priority projects identified by the Agency. The Challawa Gorge Dam Watershed Management project is a priority project the development of which may significantly impact both the bio-physical and human environments of the watershed area.

The African Development Bank (AfDB) in its review of an earlier ESIA report for the project classified it as a class A or II project that may have moderate to adverse impacts and therefore requires full ESIA/ESMP studies. This is supported both by the Environmental Impact Assessment Decree No. 86 of 1992 Laws of Federal Republic of Nigeria, and the Revised 2015 AfDB Environmental and Social Management Assessment Guidelines, which stipulates that:

"Project that is likely to have detrimental site-specific environmental and/or social impacts that are less adverse than those of Category 1 projects and can be minimized by applying appropriate management and mitigation measures or incorporating internationally recognized design criteria and standards .... require an appropriate level of Environmental and Social Assessment (SESA for program operations or ESIA for investment projects) tailored to the expected environmental and social risk so that an adequate ESMP can be prepared in the case of an investment project or an Environmental and Social Management Framework (ESMF) can be designed and implemented by the borrower in the case of program operations to manage the environmental and social risks of sub-projects in compliance with the Bank's safeguards."

Challawa Gorge Dam was built in the early-90s to supply drinking water to Kano State and supply irrigation water for Kano irrigation project. However, recently, watershed degradation has been a serious problem resulting in erosion and sedimentation problems in Challawa Reservoir, threatening the life of the reservoir and making water treatment very costly because of high turbidity. In addition, erosion in the upland watershed is affecting farmers' lands and encroaching towards private property. As a result of this, project scope has been defined to address the problem of erosion and gully formation in the watershed, reservoir sedimentation and problems in the Challawa water works treatment plant through watershed management.

#### **ES 1.1 Project Proponent**

The proponent of the project is the Hadeja, Jama'are komadudugu, Yobe Basin Trust Fund (HJKYB-TF). The ESIA/ESMP report presents findings and assessment of the assignment in line with the terms of reference with a work breakdown, and schedule for mobilization, strategy, methodology, quality assurance plan and timetable for the services execution of the consultancy. In addition, the report addresses the Safeguard instruments being prepared, the tasks to be met, the African Development Bank's (AfDB's) requirements, the timeline of the activities and the deliverables.

#### ES1.2 Purpose of ESIA Report

The purpose of the ESIA is to assess the potential biophysical and social impacts of the proposed project, which includes a detailed Environmental and Social Management Plan (ESMP). The ESIA will establish modalities of implementing the ESMP under Nigeria Environmental policies and laws and the AfDB ISS.

#### ES1.3 Objective of the Environmental and Social Impact Assessment

The objective of the assignment is to prepare the Environmental and Social Impact Assessment (ESIA) and Environmental and Social Management Plan (ESMP) in line with the AfDB's Integrated Safeguards Systems policies and adhering to country environmental standards and approved mechanisms for permit issuance. The Consultant is required to undertake an Environmental and Social Impact Assessment (ESIA) and propose an Environmental and Social Management Plan (ESMP) from the generated baseline data. The land acquisition, resettlement, compensation and valuation of land required or affected by the development shall be fully determined by the Consultant including stakeholder consultations and disclosure requirements consistent with the applicable environmental laws and regulations.

For solution to the Challawa Gorge Dam watershed management problem, two main and twelve finger gullies were identified for remediation in two pilot sub watersheds during the preparation of the project plan (SMEC 2019). For the two sub-watersheds namely PSW\_1 and PSW\_2, structural measures are to be provided inside the gullies and bio-remediation and agricultural measures to be provided on eroded gully banks and on adjacent farm lands respectively. Gabion check dams and sediment traps are the main structural measures to be constructed; the unstable section of the gullies was designed to be provided with check dams to stabilize flow and promote sediment deposition upstream of the check dams. The Check dams are designed for 10-year return period design floods and their stability is checked for a 25-year return period. Generally, about 50 Gabion check dams differing in size are to be provided in both Pilot sub watersheds (i.e. PSW\_1 and PSW\_2). Gullies with

relatively stable slopes are to be provided with embankment filled sediment traps at their outlet locations. Theses sediment traps will serve to trap sediments which come from agricultural land until the agricultural and bio remediation erosion control measures fully develop and reduce sediment. Provision is made for four sediment traps at the outlets of finger gullies in the two pilot sub watersheds. Each sediment trap is equipped with a rock riprap overflow spillway and concrete pipe dewatering orifice. The spillway is designed to pass the 25-year return period design flood while the orifice is designed to empty the 10-year design flood volume in 24 hours.

Furthermore, on eroded banks of gullies and on the adjacent agricultural lands, bioremediation and agricultural erosion control measures shall be provided. Gully banks and steep agricultural lands are proposed to be protected with provision of bio engineering (bioremediation) and agricultural erosion control measures respectively. The main bio engineering measures proposed is planting of vetiver grass. Vetiver grass was proposed on eroded gully banks by trimming and grading steep gully banks prior to planting, while the agricultural measures focus on controlling soil loss from agricultural lands by implementing agricultural practices such as contouring, strip cropping and conservation tillage involving the community and in close consultation with farmers. The other source of sediment for Challawa Gorge Dam Reservoir is from the surrounding adjacent agricultural area and from stream bank erosion in the upland watershed as non-point sources. These non-point sources are treated by providing vegetated buffer zones.

The ESIA study for this project is carried out in a way that meets the ESAP of the AfDB, the Nigerian ESIA standards and International best practices. The ESIA analyzes the environmental and social aspects including land acquisition and resettlement sensitivities in the project area and, through the consideration of alternate project designs, to develop project proposals that avoid or minimize potential adverse environmental and socioeconomic impacts arising from the implementation of the project. The study therefore will present:

 An ESIA study report including drafting a livelihoods restoration plan for the affected subjects. Issues to be addressed include but not be limited to: Soil erosion and sedimentation in the catchment areas where the project sites are located; Flooding and Water-logging issues; Health diseases issues; Fertilizer and pesticide applications; Effects on quality of water in downstream receptors; Involuntary displacement and resettlement of affected population; Soil quality, ground water, biodiversity, waste inventory and management, hydrobiology and aquatic resources as well as COVID-19, HIV/AIDS, Malaria, Typhoid and etc. awareness; and other socioeconomic conditions especially gender issues.

- An Environmental and Social Management Plan (ESMP) to mitigate the negative impacts including resettlement of affected farmers based on the following points;
  - a) Critical review and analysis all available data and information relating to environmental conditions and sensitivities in and around the proposed Watershed Management intervention areas.
  - b) Carry out complementary environmental investigations through visits and discussions at environmental protection agencies and organizations and at projected development sites.
  - c) Prepare environmental questionnaires aimed at complementing and confirming the available and obtained data and information at the level of farmers and rural community residents, to be applied during the farmer and stakeholder surveys.
  - d) Execute the environmental components of the farmer and stakeholder surveys, and assembly, processing and documentation of results for use in detail assessments and in the separate subsequent environmental impact assessments.
  - e) Prepare watershed specific characterization of existing or potential environmental issues, to serve as a basis and guideline for addressing these as warranted in the preliminary project designs and feasibility assessments.
  - f) Investigate relevant environmental studies in the proposed project area and review critically to incorporate major issues appreciable
  - g) Assess all base line conditions prevailing in and around the project areas and description of pertinent regulations and standards governing environmental quality, health & safety, protection of sensitive areas, protection of endangered species, land uses control, etc.
  - h) Assess the characteristics of the pilot watersheds such as land use/land cover, topography, soils, crop and conservation factors, climatic factors, etc. to study the extent of soil erosion or land degradation.
  - Assessment of possible pollution of drainage water from agro-chemicals and the possible effect of reduced base flows on increasing concentrations, and determine the dilution capacity of the receiving water body.
  - j) Assess the impacts on flora and fauna of the project area; and assessment of the risks of proliferation of aquatic weeds, crop pests and diseases; and evaluation of any other adverse effects of those not mentioned above, on biophysical and socioeconomic environment of the project area.
  - k) Investigate and describe alternative environmental considerations to major activities of the proposed project including design, technology, construction techniques, operation and maintenance procedures, etc.

### ES 1.4 Scope of the ESIA/ESMP Study

The aim of the Environmental and Social Impact Assessment (ESIA) is to assess the potential environmental impacts (positive and negative) of the proposed Challawa Gorge Dam Watershed (CGDWM) project and related activities, and to propose an Environmental and Social Management Plan (ESMP) to mitigate the short and long term environmental, Social and Economic challenges arising from the project implementation. The core objective of undertaking the ESIA/ESMP study is to assist HJKYB-TF in its effort to obtain environmental clearance from the Federal Ministry of Environment (FMEnv.) and thus to secure the AfDB's commitment to finance the execution of the Watershed Management Project.

### ES 1.5 Justification for the Project

There are three main problems associated with Challawa Gorge Dam Watershed that started from watershed erosion and gully formation in the upland watershed, sediment deposition and siltation of the reservoir and sedimentation problems associated with Challawa Water Works treatment plant. These three problems are mainly due to watershed degradation in the upper reaches of the Challawa Gorge Dam Watershed. To fix these problems and extend the longevity of the reservoir to realize its purpose is the main justification for the project.

The main objective of the Challawa Watershed Management project is to extend the longevity of the reservoir by reducing the sediment flux into the reservoir through integrated watershed management. This will help to significantly reduce the siltation problem in the Challawa reservoir and also contribute for the soil conservation within the watershed. It will also address the problem of sedimentation at the Challawa Water Works treatment plant.

### **ES 1.6 ESIA Report Structure**

The structure of this ESIA report is presented below.

- Executive Summary briefly highlights the main issues considered and reported in the main ESIA/ESMP Report.
- Chapter 1. Introduction Provides a background to the proposed Project and the ESIA and provides information about the Proponent.
- Chapter 2. Policy, Legal and Administrative Framework. The Legal and Regulatory Frameworks within which the ESIA was undertaken were also stated while other environmental legislation, standards and guidelines applicable to the Project were listed.
- Chapter 3. Description of project and justification. It presents the project justification,
   Page xxx of 490

the need/value and its envisaged sustainability as well as the project development and site/route options considered

- Chapter 4. Baseline conditions of the project environment. The chapter defines the areas of direct and indirect influence of the Project. It describes the biophysical and socioeconomic baseline of the Project's areas of influence and presents the public participation process in the ESIA.
- Chapter 5. Associated and social impact assessment. The chapter the approach and methodology for the impacts assessment process. It identifies and assesses potential Project impacts (biophysical and socioeconomic impacts).
- Chapter 6: Mitigation Measures. This chapter defines relevant mitigation measures to avoid, reduce, compensate or enhance Project impacts (as applicable).
- Chapter 7. Environmental and Social Management Plan (ESMP). It presents the Project ESMP, organizing all mitigation, management and monitoring requirements and management programs.
- Appendices. This section provides support information referenced throughout the ESIA.

### ES 2.0 Policy, Legal And Administrative Framework

### ES 2.1 National (Country) Laws and Legislations:

- **The Nigerian constitution**: As the national legal order, recognizes the importance of improving and protecting the environment and makes provision for it. Section 20 of the constitution makes it an objective of the Nigerian State "*to improve and protect the air, land, water, forest and wildlife*" of Nigeria. Nigeria has policy and programme instruments founded on its international, sub-regional and national commitments in the area of environmental protection, Land and water resources administration and management.
- The National Environment Standards and Regulation Enforcement Agency Act, 2007: Administered by the Ministry of Environment, the National Environment Standards and Regulation Enforcement Agency (NESREA) Act of 2007 replaced the Federal Environmental Protection Agency (FEPA) Act of 1999. It is the embodiment of laws and regulations focused on the protection and sustainable development of the environment and its natural resources. Various Legal and Legislative Instruments that are reflected in the laws that require the conduct of an ESIA to ensure that a project complies with existing environmental standards include the Environmental Impact Assessment Act, LFN, 2004; River Basin Development Authorities Act, LFN, 2004; Water Resources Act, LFN, 2004; the National Water

Resources Management Policy, 2007; the Nigerian Land Use Act CAP 202 LFN 2004 and the National Resource Conservation Action Plan, 1992 among several other National, State and Local Governments Regulations.

- Federal Environmental Protection Agency (FEPA) Act, 1988 (Decree Nº 58) and amendment Decree Nº 59 of 1992: By this Decree, FEPA was strengthened and transferred to the Presidency and expanded its mandate to include the conservation of biodiversity and sustainable use of Niger preparation of a comprehensive national policy for the protection of the environment and conservation of natural resources, including procedure for environmental impact assessment.
- The Environmental Impact Assessment Decree No. 86 of 1992, Laws of the Federation of Nigeria: The law defines the fundamental principles of environmental protection. The Environmental Impact Assessment (EIA) Act Cap E12, LFN2004 which lays down the operating rules for environmental protection procedure, is one of the implementing instruments of that law which governs the whole Environmental and Social Impact Assessment (ESIA) process. Decree 86 empowers FEPA and its custodian, to ensure that all major developments including the utilization of water resources are undertaken in a manner that does not result in unacceptable environmental impacts. In essence, the decree requires every major development projects undergoes a FEPA to shut down all offending projects and prosecute the operators.
- The National Water Resources Law: The National Water Resources Act, CAP W2, LFN 2004 on the other hand is targeted at developing and improving the quantity and quality of water resources. It vests the right to use and control all surface waters and groundwater and of all water in any watercourse affecting more than one state in the Federal Government. This act is the highest existing legislation governing water resources management in Nigeria. It confers on the Federal Ministry of Water Resources (FMWR) the responsibility for controlling the use of trans-state surface and groundwater resources throughout Nigeria. The Act represents the contemporary approach on water resources development, conservation, allocation and use that aims to optimize and sustain social, economic and environmental needs based on the IWRM approach.
- The National Resource Conservation Action Plan, (NRCAP) 1992: The NRCAP, 1992 was concerned to set out objectives for living resources conservation through, maintaining genetic diversity in order to ensure permanence in the supply of

materials to satisfy basic human needs and thus improve the well-being of society; promoting the scientific value of natural ecosystems, the study of which is required to enhance conservation itself, to improve the management of man-made systems, and to provide clues to technical innovations in agriculture, medicine and industry; regulating environmental balance in such factors as carbon dioxide and radiation levels and the bio geo-chemical cycles; maintaining ecological services through the protection of catchment's areas in order to enhance water resources and check soil erosion and flooding, protection of grazing lands against desert encroachment and the stabilization of coastal zones and; Enhancing the amenities values of natural resources, including aesthetic, heritage, religious, sentimental, ethical and recreational values on which tourism may be built.

- The River Basin Development Authorities (RBDAs)Decree 1976: The RDBAs came into existence following the promulgation of Decree 25 of 1976. They were conceived as vehicles for attaining a pan Nigerian Programme of water resources development. The current law on RBDAs is the RBDA Act cap 396 Laws of the Federation of Nigeria, 1990. This statute spells out diverse functions and objectives for these Authorities from which it may be inferred that their existence nationwide propels their acceptance as an appropriate unit for water management. Section 4(1) (a)-(d) of the RBDA Act vest the Authorities with the legal powers to undertake comprehensive development of both surface and underground water, to construct and maintain dams irrigation and drainage system, to supply water to all users, and to construct and maintain infrastructural services including roads and bridges across project sites.
- National Water Resources Institute (NWRI) Act, 1990: The NWRI enabling law is the NWRI Act, Cap 284 LFN 1990. Section 2, thereof, spells out the Functions of the institute in both general and specific terms. It is empowered to perform Engineering research function related to such major water resources projects as may be required for flood control, river regulation, reclamation, drainage, irrigation, domestic and industrial water supply, sewage and sewage treatment. The institute is further charged with the performance of other functions related to planning of water resources management and river basin development.
- **The Nigerian Land Use Policy:** The Land Use Act CAP 202 LFN 1990 sets the legal basis for land acquisition and resettlement in Nigeria. It vests land in the Governor of each State, and provides that it shall be held in trust for the use and common benefit of all people. The administration of land is divided into urban and rural land. The urban land is directly under the control and management of the Governor of each State who would hold such Land in trust for the people and would

henceforth be responsible for allocation of land in all urban areas to individuals resident in the State and to organizations for residential, agriculture, commercial and other purposes; and non-urban land, which will be under the control and management of the Local Governments.

 National Environmental Standards & Regulations Enforcement Agency (NESREA) Act, 2007: This is an agency under the Federal Ministry of Environment. It was established by Act 25 of 2007. The agency is charged with enforcing regulatory standards relating to the environment.

### ES 2.2 The African Development Bank (AfDB) Requirements and Guiding Principle

The guiding principles for the conduct of the ESIA, ESMP and RAP shall include the use of African Development Bank Guidelines and Federal Ministry of Environment legislations. Safeguard instrument for this project shall be prepared pursuant to the requirements of the African Development Bank (AfDB) Integrated Safeguards System (ISS) 2013, and the AfDB Revised Environmental and Social Assessment Procedure (ESAP) 2015, which are the cornerstone of its strategy to promote growth that is socially inclusive and environmentally sustainable. The Banks's Integrated Safeguards System (ISS) has a set of operational safeguards (OS) applicable to the proposed project. These include policies on conduct of Environmental and Social Impact Assessment (OS1), Involuntary Resettlement, Land acquisition, Population displacement, and compensation (OS2), Biodiversity and Ecosystems Services (OS3), Pollution Prevention and Control, Green House Gases, Hazardous Materials and Resources Efficiency (OS4), and Labour Conditions, Health and Safety (OS5) (table 2.1). The AfDB Revised Environmental and Social Impact Studies and reporting.

### The Integrated Safeguards System (ISS)

The Environmental and Social Safeguards (ESS) of the AfDB form the fulcrum of the Bank's support for inclusive economic growth and environmental sustainability in Africa. The AfDB applies the Integrated Safeguards System (ISS) for all projects. The ISS is designed to promote project outcomes by protecting the environment and people from potentially adverse impacts of projects. The ISS provides that all the projects funded or supported by the AfDB must comply with the ISS requirements during projects preparation and implementation. The aim of the safeguards includes:

- Avoidance of adverse impacts of projects on the environment and affected people while maximising potential development benefits to the extent possible;
- Minimise, mitigate, and compensate for adverse impacts on the environment and affected people when avoidance is not possible; and

• Help borrowers/clients to strengthen their safeguard systems and develop the capacity to manage E&S risks.

### The Integrated Safeguards Policy Statement

The Policy Statement describes the common objectives of the Bank's safeguards and lays out policy principles. It is designed to be applied to current and future lending modalities. It considers the various capacities and needs of regional member countries in both the public and private sectors. The Integrated Safeguards comprises of Policy Statement that sets out the basic tenets that guide and underpin the Bank's approach to environmental safeguards. The Bank's Integrated Safeguards Policy Statement sets out the Bank's commitments to and responsibilities for delivering the ISS in order to:

- i. ensure systematic assessment of Environmental and Social impacts and risks;
- ii. apply the Operational Safeguards (OS) to the entire portfolio of Bank operations;
- iii. support clients and countries with technical guidance and practical support in meeting the requirements;
- iv. implement an adaptive and proportionate approach to Environmental and Social management measures to be agreed with clients as a condition of project financing;
- v. ensure that clients engage in meaningful consultations with affected groups; and to
- vi. Respect and promote the protection of vulnerable groups in a manner appropriate to the African context.

| Operational Safeguard   | Description   |
|---|---|
| <b>OS 1:</b> Environmental and social assessment  | This overarching safeguard governs the process of determining a project's environmental and social category and the resulting social and ecological assessment requirements.  |
| OS 2: Involuntary   | This safeguard consolidates the policy commitments, and requirements  |
| Resettlement: Land  | set out in the Bank's policy on involuntary resettlement and incorporate  |
| Acquisition, Population   | a few refinements designed to improve the operational effectiveness of  |
| Displacement and  | those requirements.   |
| Compensation  |   |
| <b>OS 3:</b> Biodiversity and<br>Ecosystem Services   | This safeguard aims to conserve biological diversity and promote the sustainable use of natural resources. It also translates the commitments in the Bank's policy on integrated water resources management into operational requirements.  |
| <b>OS 4:</b> Pollution Prevention<br>and Control, Greenhouse<br>Gases, Hazardous Materials<br>and Resource Efficiency | This safeguard covers the range of critical impacts of pollution, waste,<br>and hazardous materials for which they are aligned to international<br>conventions, as well as comprehensive industry-specific and regional<br>standards, including greenhouse gas accounting, that other multilateral<br>development banks follow. |
| <b>OS 5:</b> Labour Conditions,<br>Health and Safety  | This safeguard establishes the Bank's requirements for its borrowers or<br>clients concerning workers' conditions, rights and protection from abuse<br>or exploitation. It also ensures greater harmonisation with most other   |

### AfDB Operational Safeguards OS1-5

| Operational Safeguard | Description                     |
|-----------------------|---------------------------------|
|                       | multilateral development banks. |

#### State Laws and Legislations:

The Nigerian Constitution allows States to make legislations, laws and edicts on the environment. The FEPA Amendment Act No. 58 of 1988 also recommends the setting up of State Environmental Protection Agencies (SMENV) to participate in regulating the consequences of project development on the environment in their areas of jurisdiction. The SMENVs thus have the responsibility for environmental protection within their states. In accordance with the provisions of Section 24 of FEPA Act 58 of 1988 (Cap 131 LFN 1990) the Kano State Environmental Protection Agency Edict was enacted. The edict empowers the State Environmental Protection Agency (SEPA) "to establish such environmental criteria, guidelines/specifications or standards for the protection of the state's air, lands and waters as may be necessary to protect the health and welfare of the people." The SEPAs are empowered to undertake functions that include, routine liaison and ensuring effective harmonization with the FMEnv in order to achieve the objectives of the National Policy on the Environment; co-operate with the FMEnv and other relevant regulatory agencies in the promotion of environmental education; be responsible for monitoring compliance with waste management standards; and to monitor the implementation of the EIA and Environmental Audit Reports (EAR) guidelines and procedures on all developmental policies and projects within the State:

- Kano State Legislations: The relevant Kano State Institutions charged with issues on environment include the State Environmental Protection Agency (KSEPA); the Kano State Rural Water Supply & Sanitation Agency (RUWASA) backed by the Kano State Environmental Sanitation Laws of 1985 and 2000; Kano State Public Health Law of 1999; and the Kano State Environment Pollution Control Law of 1985. The Kano State Environmental Protection Agency and the State Ministry of Environment are important stakeholders in the proposed Challawa Gorge Dam Watershed project. Other State Water Edicts and byelaws also form the legal basis and authority for water use and management as far as they relate to intrastate watercourses and water bodies. The present set up in Nigeria is such that virtually every state of the federation has a State Water Agency with its enabling laws. These agencies deal with individual aspects of water use to serve individual sectors of the economy.
- Local Level: At the local government level, customary laws on water use can be as important and binding as any written enactment in regulating water resources related activities especially at the level of rural community. A universally accepted principle is that all persons belonging to the community have a right to use water passing through

the community. The water right so possessed by all is, however subject to reasonable use. Reasonable right entails ensuring that the quality of water is preserved.

#### **ES2.3 AfDB Project Categorization Process**

The ESAP also includes procedural requirements such as categorising projects, disclosing and monitoring projects during implementation and operation. All AfDB financed projects will be categorised and structured to meet AfDB ISS requirements. Under AfDB ISS, each project undergoes E&S appraisal to determine a project funding feasibility as well as ensuring that the E&S considerations are incorporated effectively in the planning, implementation, and operation of the projects. Each subproject will undergo **initial E&S screening** and be categorised accordingly at the initial stage of the project cycle to determine the nature and level of E&S investigations, information disclosure and stakeholder engagement required. The categorisation is done according to the guidelines stipulated in the AfDB ESAPs.

 Based on the categorisation, the projects will then be subjected to an appropriate E&S assessment and mitigation measures will be formulated to ensure E&S considerations are incorporated in the course of the project's implementation.

# ES 2.4 International Protocols and Agreements on Water and Sustainable Environment

It is reckoned that in many parts of the world, cooperative arrangements for trans-boundary rivers, lakes and aquifers are lacking or too weak to deal with growing water-related challenges. Therefore, establishment and/or strengthening governance arrangements for these waters is considered necessary in providing the enabling environment for integrated water resources management (IWRM) and investment, and to allow riparian countries reap the numerous shared benefits that trans-boundary cooperation can offer. In support of this, countries including Nigeria became a Party to the United Nations global water conventions, i.e. the Convention on the Protection and Use of Trans-boundary Watercourses and International Lakes (Water Convention), and the Convention on the Law of the Non-Navigational Uses of International Watercourses (Watercourses Convention). The Water Convention aims to protect and ensure the quantity, quality and sustainable use of transboundary water resources by facilitating cooperation. It provides an intergovernmental platform for the day-to-day development and advancement of trans-boundary cooperation. Initially negotiated as a regional instrument, it turned into a universally available legal framework for trans-boundary water cooperation, following the entry into force of amendments in February 2013, opening it to all UN Member States, Nigeria inclusive.

#### **ES 2.5 Institutional Framework**

This section describes the leading institutions that are relevant to the formulation, monitoring implementation and monitoring of the resources Management at all levels. Institutional gaps and capacity constraints identified are also discussed in section 2.7.2 of this chapter. Relevant Institutions for Water Resources and Environmental Conservation

The Federal Government of Nigeria has established institutional frameworks at the national and river basin levels and at the state level with responsibilities for policy making, implementation, operation and monitoring at the federal and River Basin levels. The relevant institutions with a mandates in the various aspects of water resource development and environmental conservation are briefly discussed as follow:

*The National Council on Water Resources:* this is the top-most water resources policy formulating body in Nigeria.

The Federal Ministry of Water Resources (FMWR): it is responsible for implementation of federal water policies in Nigeria. The Federal Ministry of Water Resources is the major government agency that has the statutory responsibility for policy formulation and coordination for water resources development and management throughout the country. However, due to the dependence of other sectors of the economy on this critical resource, as well as the three-tier system of government which Nigeria operates several other statutory and none statutory institutions are active players in the management of water resources. These include Federal Ministry of Environment; the Nigerian Inland Water Ways Authority (NIWA), the Hadeja-Jama'are River Basin Development Authority (HJRBDA), Chad Basin Development Authority, the governments of Kano, Katsina, and Kaduna States (as riparian states to the Challawa Gorge Dam project) through their State level ministries in charge of water resources and environment, etc. Two governmental institutions, namely Federal Ministry of Water Resources and Federal Ministry of Environment are actively involved in water resources management. The HJKYB-TF is also actively involved in the overall management of the Challawa Basin water resources. Furthermore, there are overlaps in the roles and mandates of the various governmental institutions in the basin.

#### Federal Ministry of Water Resources (FMWR)

The Ministry of Water Resources was created to provide sustainable access to safe and sufficient water to meet the cultural and socio-economic needs of all Nigerians in a way that will enhance public health, food security and poverty reduction, while maintaining the integrity of fresh water ecosystem of the nation. Mandates of the Ministry include:

 Formulation and implementation of Water Resources Policy Programme;

- Development and support for irrigated agriculture for food security;
- Collection, storage, analysis and dissemination of hydro-meteorological and hydrological data;
- Monitoring and evaluation of projects and programmes for effective performance;
- Supply of adequate and potable water for domestic and industrial uses;
- Provision of adequate sanitation and maintenance of water quality
- Exploration and development of undergrounded water resources;
- Formulation and review, from time to time, of National water legislation;
- Liaison with all relevant national and international agencies on all matters relating to water resources development; and support of studies and research on the nation's underground and surface water resources potentials.

# Federal Ministry of Environment (FMEnv)

The Federal Ministry of Environment was established in 1999 to ensure effective coordination of all environmental matters, which were fragmented and scattered among different line ministries before. The creation of the FMEnv was intended to ensure that environmental matters are adequately addressed in all developmental activities in the country. In line with the above and in accordance with the administration's policy the Ministry exercises the following mandates, to:

- Prepare a comprehensive National Policy for the protection of the environment and conservation of natural resources, including procedure for environmental impact assessment of all developing projects.
- Advise the Federal Government on National Environmental Policies and priorities, the conservation of natural resources and sustainable development and scientific and technological activities affecting the environment and natural resources.
- Prescribe standards for and make regulations on water quality, effluent limitations, air quality, atmospheric protection, ozone protection, noise control as well as the removal and control of hazardous substances.
- Monitor and enforce environmental protection measures.

**ES 2.6 Environmental Impact Assessment (Eia) Act. Cap E12, LFN 2004.** An Environmental Impact Assessment (EIA) is an assessment of the potential impacts whether positive or negative, of a proposed project on the natural environment: The E.I.A Act, as it is informally called, deals with the considerations of environmental impact in respect of public and private projects.

- o Sections relevant to environmental emergency prevention under the EIA include:-
- Section 2 (1) requires an assessment of public or private projects likely to have a significant (negative) impact on the environment.
- Section 2 (4) requires an application in writing to the Agency before embarking on projects for their environmental assessment to determine approval.
- $\circ$  Section 13 establishes cases where an EIA is required and
- Section 60 creates a legal liability for contravention of any provision.

**ES 2.7 Harmful Waste (Special Criminal Provisions) Act Cap H1, LFN 2004:** The Harmful Waste Act prohibits, without lawful authority, the carrying, dumping or depositing of harmful waste in the air, land or waters of Nigeria. The following sections are notable:

- Section 6 provides for a punishment of life imprisonment for offenders as well as the forfeiture of land or anything used to commit the offence.
- Section 7 makes provision for the punishment accordingly, of any conniving, consenting or negligent officer where the offence is committed by a company.
- Section 12 defines the civil liability of any offender. He would be liable to persons who have suffered injury as a result of his offending act.

**Hydrocarbon Oil Refineries Act, Cap H5, LFN 2004**: The Hydrocarbon Oil Refineries Act is concerned with the licensing and control of refining activities. Relevant sections include the following:-

- Section 1 prohibits any unlicensed refining of hydrocarbon oils in places other than a refinery.
- Section 9 requires refineries to maintain pollution prevention facilities.

**Associated Gas Re-Injection Act, Cap 20, LFN 2004.** The Associated Gas Re-Injection Act deals with the gas flaring activities of oil and gas companies in Nigeria. The following sections are relevant to pollution prevention:-

- Section 3 (1) prohibits, without lawful permission, any oil and gas company from flaring gas in Nigeria.
- Section 4 stipulates the penalty for breach of permit conditions.

**The Endangered Species Act**, **Cap E9**, **LFN 2004**: This Act focuses on the protection and management of Nigeria's wildlife and some of their species in danger of extinction as a result of overexploitation. These sections are noteworthy:

- Section 1 prohibits, except under a valid license, the hunting, capture or trade in animal species, either presently or likely to be in danger of extinction.
- Section 5 defines the liability of any offender under this Act.

 Section 7 provides for regulations to be made necessary for environmental prevention and control as regards the purposes of this Act.

Water Resources Act, Cap W2, LFN 2004: The Water Resources Act is targeted at developing and improving the quantity and quality of water resources. The following sections are pertinent:

- Section 5 and 6 provides authority to make pollution prevention plans and regulations for the protection of fisheries, flora and fauna.
- Section 18 makes offenders liable, under this Act, to be punished with a fine not exceeding N2000 or an imprisonment term of six months. He would also pay an additional fine of N100 for everyday the offence continues.

**Sea Fisheries Act, Cap S4, LFN 2004:** The Sea Fisheries Act makes it illegal to take or harm fishes within Nigerian waters by use of explosives, poisonous or noxious substances. Relevant sections include the following:-

- Section 1 prohibits any unlicensed operation of motor fishing boats within Nigerian waters.
- Section 10 makes destruction of fishes punishable with a fine of N50,000 or an imprisonment term of 2 years.
- Section 14 (2) provides authority to make for the protection and conservation of sea fishes.

**Inland Fisheries Act, Cap I10, LFN 2004.** Focused on the protection of the water habitat and its species, the following sections are instructive:

- Section 1 prohibits unlicensed operations of motor fishing boats within the inland waters of Nigeria.
- Section 6 prohibits the taking or destruction of fish by harmful means. This offence is punishable with a fine of N3, 000 or an imprisonment term of 2 years or both.

#### ES 2.8 HJKY Basin Trust Fund (HKJYB-TF)

The Federal Government (represented by FMWR), in cooperation with the riparian States, established the Trust Fund at the Damaturu Summit in year 2006. The Trust Fund is an innovative platform for a joint intervention by the riparian states, with the support of the Federal Government of Nigeria for augmenting line agencies in addressing land and water resources issues in the KYB. Riparian state Governors contributed the equivalent of USD 6.5 million to establish the Trust Fund. The Federal Government of Nigeria matched these funds, bringing the total amount available to

establish and operate the Trust Fund to some USD 13 million.

The Governors of riparian states, in their May 2017 Summit, renewed their commitment to financially support the Trust Fund, but only FMWR and the Yobe State Government have actually disbursed their part of the pledged funds. Other state governments have approved the pledges but are yet to release funds. However, a new Board of Trustees (BOT) of the Trust Fund has been inaugurated in November 2017. During their recent meeting in April 2018, the Board undertook to persuade the remaining State Governors to provide the funds they pledged as soon as possible.

#### ES 2.9 The Hadejia–Jama'are River Basin Development Authority

The Hadejia Jama'are River Basin Development Authority (HJRBDA) was created in 1976 along with ten other River Basin Development Authorities by the Federal Government of Nigeria under Decree 25 of 1976. Presently, the HJRBDA has the largest functional irrigation schemes among the twelve River Basin Development Authorities in Nigeria. The Authority covers an area of 45,000 km<sup>2</sup> (the entire area of Kano and Jigawa states, and about two-thirds of Bauchi State) with an irrigation development potential of about 240,000 hectares within the Hadejia and Jama'are River Basin. The Headquarters of the HJRBDA are located in Kano City. The HJRBDA is responsible for the development of surface and groundwater resources for irrigated agriculture, water supply and other uses within its catchment area in Kano, Jigawa and Bauchi States. The HJRBDA has continued to develop and manage dams and irrigation projects since its establishment. These projects have a significant impact on the lives of people in its catchment area and beyond. Currently the HJRBDA has developed only 22,324 ha of irrigated land out of a potential area of 240,000 ha, which is very low progress (10.3%)<sup>3</sup>. The financial performance of the HJRBDA has been declining in recent years, and it is expected that the mandate, roles and organization of the HJRBDA will change once the forthcoming Water Bill becomes law.

#### ES 2.10 State Level

The institutional arrangements at state level in the KY Basin in general are as presented below.

#### Borno State:

The institutional framework includes the Ministry of Water Resources and State water agencies; Borno Irrigation Department in the Ministry of Agriculture and Natural Resources, and Ministry of Environment. In addition to state executive governor's directives, the Borno State Water Corporation Edict No. 2 (1999) regulates domestic water supply. The State Water Resources Edicts do not clearly define roles and responsibilities for the various State water agencies, with the result that available water quantity is not sustainably managed in the State.

#### Yobe State

The Ministry of Water Resources and State Water Board, Ministry of Agriculture and Natural Resources, and the Ministry of Environment are major managers of water resources in the Yobe State. The state activities on water issues are based on "Water supply and Sanitation policy (January 2010) and executive governor's directives. Roles and responsibilities of the various MDAs involved in managing the waters of the Lake Chad basin are not clearly defined in terms of control, monitoring and enforcement measures on water use in the State. No water resources law in the State to complement the sustainable water charter of HJKYB-TF. Hence, available water quantity was not sustainably managed in the State.

#### **Bauchi State**

The institutional framework in Bauchi state includes Ministry of Water Resources and State Water Agencies; Ministry of Agriculture and Natural Resources, and Ministry of Environment. In addition to state executive governor's directives, the Bauchi State government had reviewed in March 2013 the state water supply and sanitation policy.

**Kano State**: Kano State has a Ministry of Water Resources and State Water Board; Ministry of Agriculture and Natural Resources, and Ministry of Environment. Water related activities are based on annual budgets, Water Resources and Engineering Construction Agency (WRECA) Kano State Edict 1991, and the Water Supply Edict 2013. In addition to state executive governor's directives, there is lack of State Water Resources Edicts with clearly defined control roles and responsibilities for the various State Water Agencies involved in managing the water of the Lake Chad basin. The effect was that available water quantity was not sustainably managed in the State. The State had Ministry of Water Resources and State water agencies; Ministry of Agriculture and Natural Resources, and Ministry of Environment. These MDAs activities were based on annual budgets;

**Jigawa State:** Water Board and Sanitation Agency law 1999 (Law no. 9, 1999), and water supply and sanitation policy, in addition to state executive governor's directives. There was lack of State Edicts Water with Resource to clearly defined control roles and responsibilities for the various State Water Agencies involved in managing the waters of the Lake Chad basin. Hence, available water quantity in the State was not sustainably managed.

#### **Katsina State**

Katsina State Waste Management Act provides for the effective development and maintenance of sanitation in all areas of the State. The law further provides for proper disposition of excavated silt or earth and other construction materials after any construction project or repair works. Open burning of wastes is prohibited with stipulated penalties.

#### Chad Basin Development Authority

The Chad Basin Development Authority (CBDA) was established to promote the development of rural communities in the Chad Basin; to promote the economic empowerment of women; to encourage the participation of rural women in adult education programmes; to engage in vocational training for he women in rural areas; to provide microcredit facilities. The CBDA is mandated to address both agriculture and rural development. CBDA should make "Sustainable Agriculture and Rural Development" of Nigerians as its main goal. In line with this goal, the organization should have its own Vision and Mission that provide proper direction to the activities of the organization and the results it can achieve.

#### **ES 3.0 Project Justification And Alternatives**

#### **ES 3.1 Introduction:**

The Challawa Gorge Dam Watershed Management Project is one of the selected priority projects of the Hadeja Jamaare Kom adugu Yobe Basin Trust fund (HJKYB-TF). The purpose of the project is to extend the longevity of the reservoir by reducing the sediment flux into the reservoir through watershed management. The purpose for which the dam was constructed in the early-90s was built to supply drinking water to Kano city and supply irrigation water for the Kano irrigation project. However, recently, watershed degradation has set in resulting in the problems erosion in the watershed area and serious sedimentation problems in the Challawa Reservoir, thereby threatening the life of the reservoir and making water treatment very costly because of high turbidity. In addition, erosion in the upland watershed is affecting farmers' lands and encroaching towards private property and destroying critical infrastructure such as roads, bridges and the dam reservoir embankment. If unattended, the ecological, biological, social and economic benefits derived from the reservoir may be obliterated sooner than the expected lifespan of the dam. The need to implement the watershed management project therefore becomes imperative and necessary.

#### ES 3.2 Justification for the Project

There are three main problems associated with Challawa Gorge Dam Watershed that started from watershed erosion and gully formation in the upland watershed, sediment deposition and siltation of the reservoir and sedimentation problems associated with Challawa Water Works treatment plant. These three problems are mainly due to watershed degradation in the upper reaches of the Challawa Gorge Dam Watershed. To fix these problems and extend the longevity of the reservoir to realize its purpose is the main justification for the project. A brief description of each problem is presented below.

#### Watershed Management Problem

The watershed Management Project is necessitated by the general degradation of the Challawa Sub-basin watershed. This has resulted in related adverse environmental conditions threatening the life of the Reservoir.

#### The Challawa Gorge Watershed Degradation problem

Challawa Gorge Watershed Degradation is the main cause of erosion in the watershed, Sedimentation in Challawa Reservoir, and the Kano water works and treatment plants downstream. Natural and human factors are the main causes of erosion in the watershed (Fig. 3.1). Human activities resulting in Land use-Land Cover (LULC) due to agricultural and other human activities instigated by the increasing demand for food and other land resources associated with growing population coupled with poor agricultural practices, are some of the main causes of watershed degradation in the area (Fig. 3.2). Natural factors such as topography, soil type and slope of the watershed combined with rainfall have also significantly contributed towards Challawa watershed degradation by promoting runoff formation with anthropogenic interference as a catalyst to the process. In some places, it is also observed that the need for irrigated agriculture has forced farmers to remove vegetation from river banks for easy supply of water from the rivers and streams. These also result in damage of riparian stream buffers and expose them to severe stream bank erosion

#### ES 3.3 Potential Benefits and Beneficiaries of the Project

**Environmental Benefits**: The main objective of the Challawa Watershed Management Project is to extend the longevity of the reservoir by reducing the sediment flux into the reservoir through integrated watershed management. Thus, the project was conceived to manage environmental degradation within the Challawa Gorge Dam basin which manifests as gullies and river bank erosion. The following are the anticipated positive environmental and socioeconomic impacts of the project:

a. Reducing erodibility of the soils within the watershed and by extension reduction in siltation and sedimentation of the River Channels and the Reservoir: erosion generally increases sediment load in water and when they are generated from gully and river bank erosion, the amount of sediment load multiplies. However, with proper implementation of this project, the levels of sediment will reduce substantially by by about 75% which will in turn reduce the amount of silt and sediment in both the rivers and the reservoir.

- b. *Mitigation of Climate Change*: through planting of trees and grasses, this will positively change the land cover from bare to forested land and also provide vegetation to absorb carbon dioxide.
- c. *Protection against Strong Winds*: if the trees are properly arranged, they will serve as wind breakers which will serve as protection against violent winds that do occur during the rainy season.
- d. *Creation of Underground Water Recharge Zone*: the trees and grasses to be planted will reduce surface flow, allowing for more penetration of water through the soil thereby creating underground water recharge zone. This water can be used by the settlements upstream that mostly depend on underground water during the dry season for both irrigation and domestic use.
- e. *Pollution control:* Has the health benefit of improvement in air and water quality with the potential of reducing incidences of air and water-borne diseases;
- f. Water storage: flood control, checking sedimentation;
- g. Minimization of over exploitation of resources;
- h. *Erosion control* and prevention of soil, degradation and conservation of soil and water;
- i. *Restoration and enhancement* of environmental aesthetics value of the environment: the natural beauty and attraction of the environment will be restored and enhanced thereby promoting tourism.
- j. A hedgerow of the vertiver grass will stay where it is planted and sediment that is spread out behind the hedgerow gradually accumulates to form a long lasting terrace with vetiver protection. When used for civil systems and designs the vertiver root is likened to a "Living Soil Nail" with an average tensile strength of 1/6 of mild steel. Thus it benefits the soil by protecting it almost on a sustainable basis, and benefits the farmer by improving farm land management, crop production and overall livelihood.
- k. Vetiver grass can be used directly as a farm income earning product, or it can be used for applications that will protect river basins and watersheds against environmental damage, particularly point source environmental problems relating to sediment flows and toxic sources.
- I. Empirical evidences of numerous trials and mass applications of vetiver grass in the last 20 years in many countries also show that the grass is particularly effective in natural disaster reduction (flood, landslide, road batter failure, river bank, irrigation canal and coastal erosion, water retaining structure instability etc.) environmental protection (reduction of land and water contamination, treatment of

solid and liquid waste, soil improvement etc.), and many other uses (Chomchalow, 2005; Nguyen Van Hon et al., 2004; and Le Van Du and Truong 2006).

#### **Potential Beneficiaries**

All these applications can directly or indirectly impact on the rural poor through either protection or rehabilitation of farm land, providing better moisture retention and provision of direct farm income, or indirectly by protecting rural infrastructure. Overall, it has the potential of enhancing the livelihood of the ordinary rural dwellers through improved food production, food security and income growth.

#### ES 3.4 Potential Benefits and Beneficiaries of the Project

**Environmental Benefits**: The main objective of the Challawa Watershed Management Project is to extend the longevity of the reservoir by reducing the sediment flux into the reservoir through integrated watershed management. Thus, the project was conceived to manage environmental degradation within the Challawa Gorge Dam basin which manifests as gullies and river bank erosion. The following are the anticipated positive environmental and socioeconomic impacts of the project:

- m. Reducing erodibility of the soils within the watershed and by extension reduction in siltation and sedimentation of the River Channels and the Reservoir: erosion generally increases sediment load in water and when they are generated from gully and river bank erosion, the amount of sediment load multiplies. However, with proper implementation of this project, the levels of sediment will reduce substantially by by about 75% which will in turn reduce the amount of silt and sediment in both the rivers and the reservoir.
- n. *Mitigation of Climate Change*: through planting of trees and grasses, this will positively change the land cover from bare to forested land and also provide vegetation to absorb carbon dioxide.
- o. *Protection against Strong Winds*: if the trees are properly arranged, they will serve as wind breakers which will serve as protection against violent winds that do occur during the rainy season.
- p. Creation of Underground Water Recharge Zone: the trees and grasses to be planted will reduce surface flow, allowing for more penetration of water through the soil thereby creating underground water recharge zone. This water can be used by the settlements upstream that mostly depend on underground water during the dry season for both irrigation and domestic use.
- q. *Pollution control:* Has the health benefit of improvement in air and water quality with the potential of reducing incidences of air and water-borne diseases;
- r. Water storage: flood control, checking sedimentation;

- s. Minimization of over exploitation of resources;
- t. *Erosion control* and prevention of soil, degradation and conservation of soil and water;
- u. *Restoration and enhancement* of environmental aesthetics value of the environment: the natural beauty and attraction of the environment will be restored and enhanced thereby promoting tourism.
- v. A hedgerow of the vertiver grass will stay where it is planted and sediment that is spread out behind the hedgerow gradually accumulates to form a long lasting terrace with vetiver protection. When used for civil systems and designs the vertiver root is likened to a "Living Soil Nail" with an average tensile strength of 1/6 of mild steel. Thus it benefits the soil by protecting it almost on a sustainable basis, and benefits the farmer by improving farm land management, crop production and overall livelihood.
- w. Vetiver grass can be used directly as a farm income earning product, or it can be used for applications that will protect river basins and watersheds against environmental damage, particularly point source environmental problems relating to sediment flows and toxic sources.
- x. Empirical evidences of numerous trials and mass applications of vetiver grass in the last 20 years in many countries also show that the grass is particularly effective in natural disaster reduction (flood, landslide, road batter failure, river bank, irrigation canal and coastal erosion, water retaining structure instability etc.) environmental protection (reduction of land and water contamination, treatment of solid and liquid waste, soil improvement etc.), and many other uses (Chomchalow, 2005; Nguyen Van Hon et al., 2004; and Le Van Du and Truong 2006).

#### **Potential Beneficiaries**

All these applications can directly or indirectly impact on the rural poor through either protection or rehabilitation of farm land, providing better moisture retention and provision of direct farm income, or indirectly by protecting rural infrastructure. Overall, it has the potential of enhancing the livelihood of the ordinary rural dwellers through improved food production, food security and income growth.

#### Socio-economic Benefits

a. Allows the Dam to Operate at the Designed Capacity: this is particularly important if the purpose for which the dam was constructed is to be achieved, especially in terms of water storage capacity for irrigation and power generation.

- b. Reduction in the Maintenance Activities on the Rivers and the Dam: managing the degraded sites in the basin may reduce unwanted materials reaching the rivers and reservoir which hitherto has hindered the optimum performance of the reservoir. This will be economically beneficial to Kano Municipal water supply system not only by reducing management cost, but also improved water quality which also has positive implication for public health in and around the city.
- c. Diversification of Income: if the trees are both exotic and non-exotic, they will provide income to land owners and materials for other uses such as poles for electricity and building. The trees can also be used as collateral for loans.
- d. Sources of Fuel wood for Domestic Use: the project, if well implemented, it the long term will provide fuel wood for domestic use by the people who solely depend on fire wood for cooking and other domestic use.
- e. Reclaiming Lost Farmland: many wasted farmlands will be recovered consequently providing opportunity once again for the owners to begin to earn income from the land and enhance their standard of living.
- f. Social Safeguards: it will reduce the number of impoverished people whose situation has been brought about by reduced land for productive activities. Therefore, it will improve the overall prosperity of the areas within the catchment.
- g. To reduce the need for perennial labour emigration: long run reclamation of farm lands lost to land degradation, improvement fish and related aquatic resources in the catchments surface water system have the potential to reduce or permanently discourage perennial temporary labour temporary migration commonly known *Chin-rani* and the cases of "migrant tenant farmers" from the catchment area to other parts of Nigeria in search other means of livelihood among the Hausa people of the area.

**ES 3.5 Beneficiaries:** the Kano state government in particular, the community of farmers, herders, fishermen, including youths, women and other vulnerable groups especially within the riparian communities are potential beneficiaries of the Challawa Gorge Dam watershed management project.

#### ES 3.6 Project Sustainability

The general sustainability principles (technical, economic, environmental and social) that guided the project's design are set below.

# **Technical Sustainability**

The proposed project is technically feasible because it is professionally designed, and the technology employed is readily available and not too complex. The timing of the project when most residents of the Challawa Dam Environment and the Kano State government are

expressing concern about the continuous sedimentation of the dam with ripple effect on the water treatment plant at Panshekara supplying water to Kano Municipality and its environs.

The Hadeja Jamaare River basin Authority's pool of technical and administrative experts, and the pool of technical expert in the industrial region of Kano are encouragement for sustainability of the project. Moreover, the predominantly agricultural community of the project area constitutes a pool of employable labour to support the bio-remediation and agricultural measures components of the project because they stand to be immediate benefiaries of the project. With government political will and support the project is highly sustainable.

#### **Economic Sustainability**

The project is targeted to cover 985 Ha (around Reservoir, Pilot '1' and Pilot '2') and a further 500 ha of farmlands. There will be no immediate direct benefits for the 500 of farm lands, it is expected that the 985 ha will be placed under grass, trees, fruit trees and intercrops.

#### **Social Sustainability**

Social sustainability is contingent on social acceptability which, for the Challawa Gorge Dam, is not in doubt, judging from the ecstasy with which the communities welcomed the idea of watershed treatment for future survival of the infrastructure. Residents of Karaye and other communities in the neighborhood of the Challawa Gorge Dam in Kiru, Rogo and Turawa welcome the project which in their opinion has reduced the phenomena of temporary youth migration out of the communities for dry season job-seeking otherwise known in Hausa as *chinrani* because of the irrigation and fishing opportunities provided by the Dam. Also, the benefit to create job opportunities for unemployed indigenes especially the youths and diffusion of erosion management techniques hitherto unknown to the community of farmers would ensure social sustainability. The HJKYB-TF on the other hand nas demonstrated commitment to effective and sustained stakeholders' engagements and consultations towards the success of the watershed rehabilitation project. The proponent is also committed to complying with applicable national social laws, relevant international conventions, and AfDB safeguards requirements and training and retraining the PIU team members on environmental and social management risks.

#### **Environmental Sustainability**

The project is a rehabilitation activity to improve the functionality, sustainability and operational efficiency of the Challawa Gorge Dam which has been in existence since 1992. The watershed management is to enhance the ecosystem, improve biodiversity, protect the soil from further degradation, reduce or mitigate channel and reservoir sedimentation through bio-engineering techniques that are environmentally friendly, socially acceptable and economically viable. Moreover, social and environmental mitigation measures have been

suggested for the identified environmental and social impacts of the watershed management project.

The proponent (HJKYB-TF) is aware of, and committed to, complying with all relevant country environmental laws, applicable international conventions and AfDB environmental and social safeguard requirements to implementing the ESMP developed to guarantee environmental sustainability. The proponent also has a department that handles environmental issues related to its activities in the discharge of it mandates. The HSE department is headed by a Director who reports directly to the Bank's senior vice president. A significant number of ESIAs and environmental audits have been conducted in the past by the proponent; hence, they have the technical skills needed to manage the mitigations determined for the identified impacts of this project.

#### ES 3.7 Analysis of Project Alternatives

Watershed management technique is not a one-cap fit all-heads strategy. Several alternatives are possible. However, the choice of any approach depends much on the watershed scale (size), nature of the watershed problem, objectives of the watershed management intervention and the administrative and legal system of the management process. The cost of Watershed Management system is also a determinant of alternative choices in watershed management strategy to be adopted. Engineering and Bioremediation options designed for the Challawa gorge dam watershed may be expensive in terms of construction, management and sustainability even though its advantages are also enormous. Alternative watershed management approaches that may be possible to address the degradation of the Challawa Gorge Dam are presented in table 3.2 and discussed in subsequent sections.

#### **ES 4.0 Project Description**

#### ES 4.1 Background to the Watershed Management Project

The Komadugu Yobe Basin (KYB) covers an area of 84,000km<sup>2</sup>. It is of strategic national and international importance as it supports the livelihood of over 15 million people in six Nigerian States including Bauchi, Borno, Jigawa, Kano, Plateau and Yobe who are directly or indirectly dependent on the scares water resources. The KYB which is located in the semi-arid north-eastern Nigeria represents approximately 35% of the Lake Chad Basin and is important as a trans-boundary water resource. The Federal Government of Nigeria, in collaboration with SMEC and the African Water Facility, has prepared the Komadugu Yobe Basin Strategic Action Plan (SAP 2019) as a long-term development strategy promoting the management and use of the basin water resources for inclusive and sustainable growth and development. The Strategic action plan (SAP 2019) for the water resources development in the Komadugu Yobe (KY) basin, obtained from the HJKY-TF, identified four priority Sub-Programs/Schemes, among which is the Challawa Gorge Dam Watershed Management Sub-Program.

The Government of Nigeria through funding from the AfDB is financing additional studies for the priority investment projects. The studies include Environmental and Social Impact Assessment for the proposed Challawa Gorge Dam Watershed Management Sub-Program. In this regard the HJKY-TF (which is the Implementing Agency) seeks for consultancy services to prepare the ESIA and ESMP of the Watershed Management to assess the potential (positive and negative) environmental impacts of the proposed infrastructures construction and related activities and propose a management Environmental and Social Management Plan to address the predicted impacts for the Challawa Gorge Dam Watershed Management Sub-Project.

The SAP (2019) report identified three sets of leading problems associated with the Challawa Gorge Dam Watershed component of the HJKYB development. The previous study revealed that the problems started from watershed erosion and gully formation in the uplands watershed, sediment deposition and siltation of the rivers and the reservoir (Plates 4.1 and 4.2), and sedimentation problems downstream associated with Challawa Water Works treatment plant, all arising mainly from watershed degradation in the upper reaches of the Challawa Gorge Dam Watershed Area. Thus, the project was conceived to remediate environmental degradation within the Challawa Gorge Dam area which manifests as gullies and river bank erosion, and eventually river beds and Challawa reservoir sedimentation and destruction to critical infrastructure (Plate 4.3) while also affecting biodiversity through ecosystem destabilization.

#### **ES 4.2 Project Location**

The Project is located in Kano State Northern Nigeria, close to Karaye town about 120 km south west of Kano City, within the HJKY Basin (Fig. 4.1 and 4.2). The main Challawa Gorge Dam watershed boundary falls into three States' administrative boundaries namely Kano, Katsina and Kaduna. The project area is located in the HJKY River Basin with geographic coordinates of 11°41'21.29"N and 8° 0'49.16"E, at the Challawa Gorge Dam (figure 4.3). The watershed area covers about 3,842 km<sup>2</sup> with an altitude ranging between 520 to 720masl. It is a major reservoir on the Challawa River, a tributary of Kano River. The Challawa Dam itself lies astride the land areas of three riparian local government areas of Karaye, Rogo and Kiru in Kano State. Although the upper reaches of the Challawa Sub-basin watershed extends to parts of Katsina and Kaduna States, the greatest areas of the project likely to be more affected lie in Kano state, especially areas in Karaye, Kiru and Rogo Local Government Areas. The Challawa River itself forms a tributary to the Kano River which drains into Tiga Dam in Kano State and further downstream of the Hadeja Jamaare river system in Jigawa and Bauchi States.

#### ES 4.3 Objectives of the Challawa Gorge Dam Watershed Management Project

The Challawa Gorge Dam Watershed Management Project is one of the four priority projects selected for development by the HJKY-TF. The overall objective of the project is to extend the longevity of the Challawa Gorge Dam reservoir by reducing the sediment flux into the reservoir through watershed management, involving design of erosion control structures, provision of bioremediation and other agricultural measures; and construction of gabion check dams and sediment traps, etc. The SAP (2019) of the Challawa Gorge Dam rehabilitation project noted that the project is expected to significantly reduce the siltation problem in the Challawa reservoir and contribute significantly to soil conservation within the watershed, and also address the problem of sedimentation at the Challawa Water Works treatment plant with all the associated positive effects

# ES 4.4 The Project Components and Activities

#### General Site Description of the project

The Challawa Watershed management project is aimed at erosion and gully control and reducing sediment deposition in the reservoir through watershed management intervention. The proposed watershed management work largely includes provision of erosion control structures in the upland active watersheds producing large amounts of sediments. For this purpose, two pilot sub watersheds were selected and appropriate erosion control measures were designed and presented for the two sites.

The selected Pilot sub watersheds have been designated as **PSW\_1** and **PSW\_2**, each containing its own main and finger gullies and draining into the main rivers that later join the Challawa River (fig. 4.4). The gullies identified in the two sub watersheds (PSW\_1 and PWS\_2 and the works to be carried out on each are presented in table 4.1. The gullies have very steep slopes from the head to middle reach and tend to have milder slope near the outlet, forming a relatively stable and wide bed. The gullies are expanding upstream by head cutting and laterally with stream bank erosion. Urgent intervention is needed to stop the gully from developing laterally and endangering the surrounding farm land and deposition of sediments in the downstream reservoir. The gully is shallow at its tail and is deeper in the middle and head section, up to 30m depth. The width of the gully varies from 60m at shallower areas to 30m at the deeper sections. The shape of the gully is generally V-shape gully at the head and middle with a side slope ranging from 30° to 40°. In Pilot Sub Watershed 1 gully site, the level of gully erosion is so active that it is progressing aggressively towards the adjacent farm lands encroaching into private properties.

| Description | Length (m) | Proposed Work   | Remark |
|-------------|------------|---|--------|
| MG          | 4,581      | Bank protection, Check Dams, sediment trap and buffer | PW_1   |
| LFG-1       | 1,006      | Bank protection and Check Dams                        | PW_1   |

#### ES 4.5 Stream bank stabilization with Bio-remediation

#### Grading and trimming

The middle reach of the gully has relatively narrow and very deep exposed gully bank section with slope varying from 45 to 50 degrees. This slope is not stable for such poorly structured geological formation. Therefore, the slope of gully banks is proposed to be graded with the following recommendations:

- Provision of graded slope of 1:1.5 with 4m wide berm at the middle of the bank, the proposed graded bench is horizontal and along the contour and interceptor drainage is provided every 10m elevation interval in order to intercept the storm water and evacuate to the collector drain.
- Provision of bio-degradable geo matt on the treated surface where the gully slopes are steep and exposed the geo-matt will create a support of the banks until the bio-remediation is fully developed.

Even with bank stabilizing measures, the gully banks are still vulnerable to further erosion by uncontrolled surface stormwater runoff from the surrounding areas. Hence, protection measures are provided. After careful analysis of various types of bank protection measures, vetiver grass was selected and explanation provided in the following sub section.

#### ES 4.6 Bio-remediation (Vetiver grass)

The non-vegetated slopes are subject to frequent and sometimes serious erosion process, due to storm water runoff. The gully banks are exposed in active reaches of the gully and are vulnerable to surface erosion from direct rainfall. These exposed surfaces shall be covered with vetiver or other fast growing deep rooted grass in order to minimise the formation of rill type of waterways. Bio-remediation measures can be used to protect gully bank walls and prevent erosion. They provide important resistance to erosion forces and more aesthetic and environmentally friendly than other structures. Accordingly, the main bio-remedial measure proposed at Challawa Gorge Dam Pilot Sub watershed site is planting of vetiver grass on gully bank slopes of less than 40<sup>0</sup>.

# ES 4.7 Erosion control structures: The Engineering Construction Component of the Project

Structural (engineering) measures to control gully formation and check channel and reservoir siltation are to be constructed inside the gullies while bio-remediation and agricultural measures are to be provided on eroded gully banks and adjacent farm lands respectively to stabilize soil, and reduce surface flow. Gabion check dams and sediment traps are the main structural measures to be provided at selected sites. Selection was done in an earlier study (SMEC, SAP 2019) after proper identification of erosion processes and hydraulic phenomena, including water surface and velocity profile inside gully channel. Comparison

was made in the existing and stable slope. The unstable section of gully is designed to be provided with check dams to stabilize flow and promote sediment deposition upstream of check dams. Check dams are designed for 10-year return period design floods and their stability is checked for a 25-year return period. Generally, over 50 Gabion check dams of differing in size, are to be provided in Pilot sub watersheds of the Challawa Gorge Dam.

#### **ES 4.8 Construction Activities**

The construction activities shall be handled by competent professionally skilled contractor to handle the Engineering, Bio-engineering and Agricultural components of the project. The project proponent i.e. the Hadeja Jamaare Komadugu Yobe Basin Trust Fung (HJKY-TF) is not equipped technically and professionally to execute the construction work due to absence of the required manpower. Thus, the contractor may have to import professionally skilled man power from outside the project area while some component of the unskilled labour input may be attracted from the local communities of the project area. The contractor must consider and apply legally binding labour regulations of the country including minimum wage standards and in accordance with global best practices.

Construction material both physical and biological available in the project area is inadequate and must be provided from outside the project area. While rock materials may be carefully mined from the local environment that is charaterised by rock out crops and granitic beds for the construction, the extraction of such materials must be done considering environmental sustainability with minimum encroachment on farmlands or developed areas and without further damaging gully prone sites. Veriver grass seedlings may have to be raised in nurseries and natured for transplanting. Vertiver grass can grow over a short period of 45 -60 days with good husbandry practice. However, vertiver seeds may not be available within the project area and must be acquired from outside the watershed region.

Subsisting land tenure laws of the country described in section 2.2 of this report is to guide land acquisition for the project and where necessary adequate compensation should be granted all affected land owners/user for any land and or crops affected by the project. The more likely groups to be affected directly and indirectly by watershed remediation activity are the members of the local community (land owners, farmers, animal herders etc.) in the project area especially in Rogo, Karaye and Kiru Local Government Areas of Kano State.

# ES 4.9 Activity Phases

Project activities are phased for ease of construction and monitoring progess. The phases are discussed under the following sub-headings:

- Mobilisation or preconstruction phase,
- Construction phase,

- Operation/Maintenance Phase, and
- Decommissioning phase

The proposed project involves Gully bank stabilization, erosion control, sediments control on main and some of the Challawa river tributaries and ecosystem enhancement of the Challawa Gorge Dam watershed.

# ES 5.0 Description Of Project Environment And Baseline Conditions

#### ES 5.1 Introduction:

The purpose of the baseline data acquisition was to establish, the status of the various environmental components that are likely to be affected by the proposed project. In order to achieve this, environmental parameters were determined from literature survey, fieldwork, laboratory and data analyses. The components of the environment evaluated covered biophysical, social and health. The ESIA study of the project incorporated data from already approved Environmental Impact Assessment reports as secondary data which include amongst others, the Challawa Gorge Dam Rehabilitation Project Strategic Action Plan 2019, and the ESIA for the 330/132/33kV Transmission Substation New Kano, Kano State.

The Challawa Gorge Dam Management project is designed to be carried out in three preselected areas which are typically representative of the entire sub-watershed in terms of physical (topographic, drainage, soil and vegetation) as well as their human occupancy, land use and agricultural practices. The details of Pilot sub-watershed selection process are clear defined in an earlier Strategic Action Plan Report for this project (SMEC 2019, Volume 1 A). The general environmental, ecological and social conditions of the project site made up of (i) Dam Site, (ii) Pilot Sub watershed\_1 (PWS\_1) and (iii) Pilot Sub-watershed\_2 (PWS\_2), are described below. The Project Area of Influence (AOI) i.e. the geographic area likely to be affected by the project is also highlighted.

# ES 5.2 General Overview of Conditions of Project Sites

The pilot catchment management sites are located in a remote area which has an undulating and heavily rugged topography (Plate 5.1) with isolated hills. The area is situated within the southern guinea savannah region, with two distinct climatic seasons; wet and dry seasons. The area receives plentiful sunshine all year round, ranging from 11 to 13 hours per day.

The main river that drains the area is River Challawa. The river is seasonal and the quantity and quality of the water reduces drastically during the dry season. The flow of water from the dam is regulated to allow water flow downstream during the dry season for domestic use and irrigation farming. The water for domestic use at Kano is pumped to Panshekara, at the outskirts of Kano where the water treatment plant is located. The irrigation component is yet to be developed. Recently, the Kano state government announced expansion of use of the dam to cover power generation, with some slight modification of the dam required to accommodate the power plant.

The soils surrounding the sites are of different types and can be generally classified as sandy in nature and relatively deep in most places, as evinced at the gully sites, though there are isolated small rocky outcrops scattered around the two sites. A cursory look at farm lands also reveal that the soils are mostly sandy loamy because of the various management practices put in place by the farmers including intensive cultivation without fallow period, ploughing, application of farm yard manure etc., to improve soil for better crop harvest (Figure 5.2). There are a few boreholes and several tube wells located within the nearby settlement and along the roads, for both domestic and agricultural use. The existing land use of at the pilot sites are mainly agriculture for both crop farming and animal husbandry. Other minor land uses are settlements, roads, and for social services like schools, health care centres and open play grounds. The crops produced include maize, guinea corn, groundnuts, beans, soya beans, rice, potatoes, sugar cane, cassava, and other vegetables such as tomatoes, onion and pepper. The animals (usually few in number) raised by individuals include cows, goats, sheep, horse and donkeys. At the settlements, poultry such as fowls, chickens, turkey and ducks were found roaming around freely.

#### ES 5.3 Area of Project Influence (API)

The area of Potential Project Influence (API) both direct and indirect is identified in terms of coverage or extent of the impact, is determined as the degree, extensiveness or scale of influence. The Project's API is the geographic area where direct or indirect impacts are likely to be experienced. In other words, areas where primary or secondary effects resulting from the project are likely to happen.

Overall, the Challawa Gorge dam watershed covers an area of 3,842 km<sup>2</sup> but the measures proposed cover two pilot sub-watersheds with a total area of 3,150 ha (about 31.50 Km<sup>2</sup> or about 0.82% of the watershed) for pilot\_1) and 2,661 ha (26.61km<sup>2</sup> or 0.69% of the watershed) for Pilot \_2. The API is estimated base on three considerations in terms areal extent from the end point of buffering/bioremediation, i.e. from a maximum of 60m from Reservoir and gulley banks which make up the footprints of the erosion control measures. viz:

- a. On site (within 500m<sup>2</sup>)
- b. 3 km-5km<sup>2</sup>
- c. Beyond 5 km<sup>2</sup>.

Thus the area of influence is expected to go beyond 5km from the project footprint which includes the 1458 Ha covered by the direct project, out of which 500 Ha will be on farmlands belonging to individual farmers. All project activities will be carried within the footprint area defined below.

- Around reservoir (475 Ha) at 60m from Reservoir embankment;
- In Pilot area \_1 (276 Ha) along gully banks, at 30 m-60m from gully banks;
- In Pilot area (218 Ha along gully banks, at 30 m-60m from gully banks;
- In Buffer strips in Pilot area\_1 and Pilot area\_2 (covering 16 Ha), along main and finger gully banks, at 15m-30m from gully banks; and
- On farmlands (500 Ha).

The Project's Areas of Direct Influence (ADI) within and outside of the footprint area includes the biophysical and socioeconomic impacts. The Project's ADI is therefore demarcated as in figure 5, a schematic representation of the areas of influence. The influences can be categorised into two: Biophysical and Socioeconomic influences. Figure 5.1 provides a graphical illustration of the Areas of Influence.

# ES 5.4 Geographic and Environmental Settings of the Project

Baseline information describes the general physical and socioeconomic conditions of the project environment.

# Sampling Procedure

The sampling procedure was established during Scoping. These measurements were made in situ to establish the Environmental Baseline:

- Meteorology
- Air Quality and Noise
- Soil, Land use and land cover
- Vegetation and Wildlife
- Geology/Hydrogeology
- Surface water
- Socio-economics
- Health

# ES 5.5 Geographic and Environmental Settings of the Project

Baseline information describes the general physical and socioeconomic conditions of the project environment.

#### Sampling for Physical Characteristics study

The field sampling program took place in July – August 2020 as shown in table 5.6. Parameters such as temperature, pH, turbidity, electrical conductivity and dissolved oxygen were determined *in situ* because of their rapid change on storage. For other parameters samples which could be subject to microbial degradation and transformation were preserved, stored and analysed at minimum time after collection. This combined Work Plan/Field Sampling and Analysis Plan (FSAP) addressed the field sampling, analytical, quality control, and data review procedures for the collection and analysis of sample. For Climatic data

#### **Samples Collection and Analytical Methods**

Baseline data for the study area were generated using a combination of literature survey, field studies; analysis of maps, review of background project documents; site reconnaissance surveys; structured and semi-structured interviews via engagements with the affected riparian communities, focus group discussions (FGD), Key Informants Interviews (KII) as well as a collection of field baseline data for a number of indicators using in-situ measurement methods.

Part of this section relies on existing data as surveyed from relevant literature sources as well as field study and data analysis. Dry and wet season data were obtained from the extensively available literature (SMEC 2019; SMEC, 2015 ESIA for the Proposed 330/132/33kV Transmission Substation New Kano, Kano State Olofin 1987; Waziri, Zakaria and Audu 2015). Since the ESIA study is a one-season (rainy season) study, field sampling survey was used to generate current information (rainy season) for the project area. Dry season data were derived from similar approved ESIA report for the region (Kano Region) (SMEC, 2015)

For the purpose of both physical and socioeconomic sampling, a system of square grids was superimposed on the study area to randomly select sampling locations for air, water and soil studies. A total of 20 sites were sampled in the three project areas namely PSW\_1, PSW\_2 and Dam Site. However, samples were collected from 10 sampling points around PWS\_1 and the Dam site. The PWS\_2 sites could not be visited due alleged prevailing insecurity associated with banditry in the remote area. Samples were therefore collected around 10 village areas including Rogo, Turawa, Sakarma, Daura Gari, Yola, Gumshi, Dam Site, Jerre and Challawa.

#### Air Quality & Noise Studies

Sampling was for a period of eight hours per day with readings of all the parameters determined every hour. The eight-hour monitoring period was carried out from day to day so Page **lxvi** of **490** 

that reading could be taken from early morning to late at night over the monitoring period. Information on air quality along the route was generated by on site monitoring of air quality at the proposed route locations. This data was supplemented by desk based assessment of historical data from various locations.

#### Air Quality Parameters

A Portable AeroQual Series 300 Monitor and a Portable Environmental Sensor meters (ASTM D3249-95) were used. Air was pumped continuously from the atmosphere and a portion of the sample automatically sent to the analyzer for the determination of the gaseous pollutants of interest. The analyzer contains modules of each gas that analyzes the quality of the gases in the ambient air. It is a digital meter, which reads parameters at a time weighted average. (NOx, model Z-1400; SOx model Z-1300; NH<sub>3</sub> model Z-800; H<sub>2</sub>S model Z-900; CO model ZDL-500 all manufactured by Environmental Sensors Ltd and VOC using AeroQual monitor).

#### **Suspended Particulate Matter**

Suspended Particulate matter were determined using Met one instrument, Met One Aerocet 531 Mini volume portable Air sampler manufactured in USA, (ASTM D4096-91).

#### Noise Level

Noise levels at the different sampling points were measured with the aid of a pre-calibrated digital readout noise meter. The noise sensor of the meter was directed towards the source of noise and the average reading over a period of 5 minutes was measured in decibels (dB). An EXTECH INSTRUMENT (China), model 407730 Sound level meter with measuring range of 40 dB (A) – 130 dB (A), accuracy of  $\pm 1.5$  dB (A) was used for the monitoring.

#### **Microclimatic Data Collection**

Microclimatic Data was gathered using a calibrated hand held and battery powered high precision Kestrel 4500 pocket weather Tracker for wind speed, humidity, temperature and wind direction.

Climatic and meteorological data were obtained through field measurement of some of microclimatic conditions (including relative humidity, wind speed and direction, ambient air temperature), and the climatic and metrological conditions from secondary sources including the Nigerian Meteorological Agency and other online weather trackers. For the ambient microclimatic conditions field survey, an automatic mini weather weather station was set up in an open ground at various sampling station and allowed to run for a minimum of 30mins in order to establish a microclimatic baseline of that particular station. All precautions usually

taken when setting up a weather station and during measurements were observed for the onsite measurements.

These include setting up the weather station away from obstacles like buildings and tall vegetation, using an instrument shelter to display all temperature sensitive instruments, orienting the instrument shelter so that the sun's radiation does not fall directly on the instrument during reading and setting up the weather station in an area representative of the study area's totality, as prescribed by the World Meteorological Organization (WMO) standard.

#### Soil

Soil samples were collected from each of the stations with the aid of a Dutch Hand Auger, Hand gloves, a spool and hammer at depths of 0-15cm and 15-30 cm, representing top and sub-surface samples from eight (10) locations (Plates 5.5 (a) and 5.6 (b). These depths correspond with the depths at which most (>80%) of the plants roots and soil micro-organisms are concentrated.

#### **Vegetation Studies**

Vegetation studies were conducted at the same sampling locations as those for soil studies to determine the species composition, diversity and population of plant species. The density and percentage of the major tree species and the herbaceous layers were determined. In addition, the rare and endangered plant species as well as plants of special significance to the ecosystem and the local economy were classified.

#### Wildlife

Wildlife studies involved a census/count of mammals, birds' reptiles and amphibians sited around the project area. Direct count using a pair of binoculars for sighting was employed for the census of reptiles, birds and other animals that readily appeared during the investigation. The presence of some of the animals was ascertained by probing such habitants like logs, heaps of dead decaying leaves, vegetated areas, ponds and burrows etc. The wildlife sighted, were identified on the spot to ease with help of field guides. Survey of literature relevant to the project environment in (the ESIA Report for the Hadejia Jama'are Sub-Basin with Kano River Irrigation Scheme (KRIS) and Hadejia Valley Irrigation Scheme (HVIS) 2017; and (ESIA) for the Proposed 330/132/33kV Transmission Substation New Kano, Kano State, SMEC March, 2017) also provided opportunity to supplement information on wildlife existing in the area.

#### **Aquatic Studies**

Acquatic studies include study of Surface and Groundwater water in the project area. Samples were collected from 4 existing sources including the Challawa Reservoir, Gumshi river, Jerry River, and upstream of Challawa River. Ground water was collected from boreholes in the area.

A water sampler was used to collect water samples at designated locations. Samples for Total Hydrocarbon Content (THC) measurements were placed in 1liter glass containers concentrated hydrochloric acid (HCI) added and sealed with aluminum foil. While the samples for the heavy metal analyses were placed in 150ml plastic container concentrated nitric acid (HNO<sub>3</sub>) added to adjust the pH to 2. Biochemical oxygen demand (BOD) samples were collected in 250ml brown reagent bottles, sealed to exclude air bubble while the dissolved oxygen (DO) samples were fixed immediately with Winkler's I and II reagents. Unstable physiochemical parameters of water such as pH, DO, temperature, salinity, turbidity and conductivity were measured in-situ using pre-calibrated portable digital meters. All samples were preserved in a cool box and transported to the laboratory for analyses.

#### ES 5.6 Design of the Socioeconomic Survey

Several techniques and methods were adopted forb the socioeconomic baseline data collection. These include the use of interview schedules/questionnaire, Key Informant Interviews (KII) and Focus Group Discussion (FGD) as primary sources. In addition, and very importantly, as a primary technique of data gathering, community consultations. Visitations were also carried out on the existing social infrastructural facilities and services, e.g., education and health care infrastructure for necessary information on education and health. As a survey instrument and primary data gathering method, the questionnaire was structured such that binary, optional and open-ended questions were raised to solicit the necessary answers to questions from the community members who were on ground.

#### ES 5.7 Microbiology

#### **Methods of Sample Collection**

Water samples were collected in accordance with the procedures described in standard methods for water and wastewater analysis (APHA, 1998). The same is accepted and adapted by FMEnv as standards for Nigeria. According to the procedure, 200ml of sterilized sample bottle was used for collecting water sample.

The samples were preserved in an ice-cooled container and transported to the laboratory for analysis. All analysis was carried out at the Kano State Ministry of Environment Laboratory, Kano, Kano State.

#### **Quality Control Measures**

i) Clean sterile containers were used for sample collection to avoid external contamination of the sample.

ii) Sample was transported in an ice packed cooler to the laboratory and analyzed within 2 hours of collection or stored in refrigerator for analysis at other days.

iii) Procedures for sample collection were done aseptically and in accordance with standard procedures.

#### Methods of Sample Analysis

# (a) Enumeration of Bacteria

Serial dilution procedure as described by Obire and Wemedo (1996); Ofunne (1999) was employed for cultivation and enumeration of bacteria and fungi in the water samples. The ten-fold serial dilution was used to obtain appropriate dilutions of the samples. Aliquots of the required dilutions were plated in duplicates onto the surface of dried sterile nutrient agar (for total heterotrophic bacteria). In case of total/faecal coliform bacteria, the most probable number (MPN) technique described by Collins and Lyne, (1980) was employed for estimation of their numbers in water. Appropriate volumes of undiluted water samples were inoculated into test tubes of MacConkey broth medium. All inoculated media were incubated at 37<sup>o</sup>C for 24 hours or 3-7 days except for faecal coliform bacterial set up incubated at 44.5<sup>o</sup>C.

# **Chain of Samples Custody Procedure**

There is a Master Register for all samples brought into the laboratory. Following registration of the sample, a Sample Data Sheet containing pertinent information on the sample was opened for each sample. The information includes:

- a) sample reference number;
- b) nature or type of sample;
- c) site of collection;
- d) date and time of collection; and
- e) Mode of preservation (depends on nature of material) and analytical data from the field.

Appropriate methods were used in storing the remaining stock materials and sub samples. Samples for storage were kept in labelled compartments on shelves in a storage room. Samples sent to co-operating laboratories were recorded in the Master Register and accompanied by essential data pertaining to the sample material.

# ES 5.8 Geological, Hydrology and Geomorphic Characteristics

# **Geology of the Project Location**

The literature survey suggests that the project area in fig. 4.2 is geologically characterized by mainly impermeable basement complex rock formations. Bawden, *et al.* (1973) described the region as being part of the northern plains which is largely characterized by extensive very gently undulating plains sloping gradually from over 600 meters above sea level south and west of Kano and to over 1,000masl north of Jos to less than 300masl towards the Lake

Chad. The river systems in the area provide extensive flood plains that are used for livelihoods.

Pre-Cambrian rock of the basement complex which comprises of gneisses, amphibolite, marbles and the older granites which underlie large parts of Nigeria including the Kano Region (Adamu *et al*, 2014). The Granites are generally Gneissic and commonly developed in a mixture of Pegmatite of schist granite, Gneiss and irregular mass of pegmatite. The Aeolian sand derived from wind deposits cover most part of the area with thickness of about 5 meters in the upland and 10 meters along the lowland plains (Olofin, 1987). The geological structure influences the relief as well as landforms which are relatively flat, with some undulation especially around upstream of the drainage system of the area. The relief of the area has been categorized into four types comprising south and south eastern highlands; the middle and western high plains; the central lowlands and the Chad plain. The highlands occupy more than 50% of the surface area of the region and lies on an elevation ranging between 450 to 650masl. The high plains consist of areas of low relief, usually less than 20masl and areas of grouped hills where the hill may rise higher than 100m above the plains. The plains are developed on rocks of the Basement Complex.

The Hadeja Jamaare Basin is geologically underlain by Basement Complex upstream and the Chad Formation to the middle and downstream. While the upstream part of the basin is characterized by mainly impermeable Basement Complex rocks covered by the permeable quaternary sediments which consist of fine to coarse grained sand, with intercalation of sandy clay, clay and diatomite, the dunes in the middle part of the basin and alluvial deposits along the river systems are superficial deposits lying on the Chad Formation. The river alluvium deposits consist of sands, silts and clays with occasional existence of coarse sands and gravel along younger river channels.

#### **Groundwater Availability and Uses**

Groundwater availability varies in the region. Various factors affect its availability. The most recognized and important one is the geological differences. In their study Abubakar et, al (2018) revealed that, the volume of groundwater decreases from the Chad Formation to the Basement Complex region, with Birniwa area in the Chad formation region and Zarewa in the Basement Complex region where this project area lies, having volumes of 9.363.0m<sup>3</sup> and 49.0m<sup>3</sup> of groundwater respectively. Thus, groundwater availability is much higher in the Chad Formation than in the Basement Complex.

The Chad Formation in the Kano region is one of the largest accessible stores of fresh groundwater, and for that groundwater is often considered a logical resource in the region. Conversely, in the Basement Complex region, rapid rising population growth in association with urbanization and climate change have led to intensive exploitation of groundwater through construction of boreholes, principally for domestic water supply. Groundwater in the

urban Kano area for instance appears to be a common and low-cost alternative to surface water for many uses because it occurs generally in a more potable quality compared to surface water. However, despite the growing dependency upon groundwater for different uses in the Kano region, concerns remain over the sustainability of this resource principally in terms not only of the rate of abstraction but also in terms of the quality and quantity because the area is underlain by igneous structure.

#### **Results of Soil Analysis**

A Summary of the results of soil analyses including physical and chemical properties are presented in table 5.16. The detail result of analysis are attached as **Appendix 5**.

#### ES 5.9 Groundwater and Surface Water Quality

#### **Groundwater Availability**

Ground water is a major source of water in the Challawa sub-basin of the Hadeja Jamare Komadugu Yobe Basin. In some areas, especially in the study area, it is the leading source of water for domestic and other non-domestic uses. It is a basic resource that is for livelihood sustainance. High groundwater use occurs in the eastern part of the Basin by exploitation of the shallow unconfined and deep confined sedimentary aquifers. In the eastern part of the Basin, surface water use is limited due to low rainfall, flat topography and high infiltration rates which limit construction of surface water impoundments. Groundwater recharge in this part of the Basin is enhanced by riverbed and flood infiltration along the river valleys during time of flooding and releases from the Challawa Gorge and Tiga dams). Estimated annual groundwater availability varies from 2,317MCM/yr in 2018 to 1,279MCM/yr in 2019 (SMEC 2017. It is estimated that by 2040, annual sustainable groundwater availability will decrease to 70% of the current estimated volume due to climate change, assuming a decrease in rainfall.

Groundwater occurrences revealed the hydrogeological maps compiled for this study revealed that groundwater is available in three media which are: - Alluvial Aquifer, Soft Overburden Aquifer and Fractured Crystalline Aquifer. The Alluvial Aquifer are found in Rivers e.g. River Kurma, River Takwami, and River Magaga, which are perennial containing water during the dry season. These aquifers are important for small scale irrigation by shadoof system called *Jigo in Hausa* to water crops and vegetable like onions, tomatoes etc. during the dry season.

Soft overburden aquifer consists of saprolite and regolith and is derived from the weathering product of the Basement Complex rocks of elluvial and alluvial origin which makes it heterogeneous. Most of this aquifer are tapped by hand-dug wells and are seasonally

bearing water in wet seasons and some at end the of the dry season. This aquifer covers most parts of the Project area with a minimum depth of 6 m to maximum of 32 m. On the other hand the Fractured Crystalline Aquifer is also perennial and continuous throughout the year and can be tapped by borehole.

## **Baseline Groundwater Quality**

The Physico-chemical analysis results of groundwater collected in the project area during wet and dry seasons are presented in *Appendix 5.* The quality of the groundwater samples was compared with WHO drinking water quality index, with most of the parameters recorded to be within WHO drinking water quality index. The water is generally clear and unobjectionable in terms of odour and other physical appearances.

## ES 5.10 Land Use

In most parts of Nigeria, land use had been determined by tenurial systems evolved over time and determined by the perceived demand as well as the potential and actual social pressures associated with its supply and use (Powell, 1995; Swallow and Kamara, 2000). Land use in the study area comprises the built environment including residential and nonresidential buildings, industrial buildings, cultural lands such as religious grounds, cemeteries, recreational grounds, roads and paths, market places etc. Other land uses include agricultural lands, forest cover, etc.

The project site and its environ were visited to obtain familiarity with the landscape and surrounding countryside areas. Field studies have included the recording of landscape features, the evaluation of landscape character and quality, and establishment of representative viewpoints. Desk studies have been carried out including a study of the local topography and land use using maps, aerial photographs and photographs taken during field studies and reference to other ESIA reports for projects around the study area (including ESIA (2017) for the Hadejia Jama'are Sub-Basin with Kano River Irrigation Scheme (KRIS) and Hadejia Valley Irrigation Scheme (HVIS), and the ESIA for Transmission Company of Nigeria Project Management Unit (TCN-PMU for the 330/132/33kV Transmission Substation New Kano, Kano State SMEC March, 2017).

The land cover on farms is mainly crops grown by farmers with scattered trees of average to large height and size. The trees are mainly locust bean, tamarind, local mahogany, guava, neem (*darbejia*), and mangoe trees. The uncultivated patches of land around the settlements, there are other species such as Dorawa, Dinya, Kanya (Hausa names for the trees) and many others of economic and medicinal values. The tree density improves and in

some cases forms clusters on uncultivated/uncultivable lands especially around the main and figure gully banks.

There are shrubs and grasses that grow freely in several locations within the area. Figure 5.28 and figure 5.29 fairly depict the land use/land cover types in the two pilot sub watersheds of the project area. On both pilot sub-watersheds, the lands are intensively under crop cover especially in the rainy season, while eroded areas are generally uncultivated or uncultivable. There are patches of built up areas of small to medium size settlements on both pilot sub-watersheds.

#### ES 5.11 Socio-Economic Environment

A socioeconomic assessment of the project area gives an insight into the social, cultural and economic conditions in the project area. A blend of methods including the following, were adopted for data to gathering.

- i. Review relevant literature;
- ii. Review of existing, reports of Nigeria Demographic and Health Survey ;
- Reconnaissance survey to identify the focal communities (Karaye, Rogo, Kiru L.G.As) and the likely adjoining communities that might be directly or indirectly affected by the proposed project;
- iv. Focus Group Discussions (FGDs) with stakeholders and project affected peoples (PAPs) in areas closest to the footprint locations of the project.

#### **Settlement Characteristics**

The settlements system consists of permanent structures made from grass, wood and sand and, in a few cases, concrete blocks and iron roofs. The main settlements are Karaye, Rogo and Kiru which are LGA headquarters. Several other towns such as Tsara, Turawa and Soho Rogo are fairly big settlements with many other smaller villages such as Unguwan Datti, Dayi and temporary Fulani herdsmen huts scattered around.

The estimated 2016 population of the most affected areas is 888,600 people. The estimated population structure of the people living in the area and in the immediately surrounding hamlets was an average of 30-40 people, mostly constituted of 2 to 3 families per hamlet, with demographic structure of more children and youths compared to adults and with the less males compared to females. The family system is mainly monogamous but it is mostly dictated by economic resources of the man. The average number of births per woman is six and each household has about eight to ten people. The economic activities are mostly farming and commerce. Both men and women participate though with different roles. On the farm, the men mostly do the tedious jobs of cultivation, making of ridges/canals for water reticulation and transportation of harvested crops to markets for sales and to homes for food, while the women participate in planting, weeding and harvesting. In families that have no men, the women do all the tasks.

The 2015 population and average population density for each of the four main sub-basins is given in Table 4.1 of the HKY Basin is about 200 persons/km<sup>2</sup>. This indicates that the Basin is the most populated area in the northern region of the country. The Challawa Gorge Dam Sub-basin area which lies within the Kano Close Settled Zone with its high population density is exerting pressure on the water resources of the area. The population of the region is mainly engaged in both rain fed and irrigation farming, in addition to other non-agricultural commercial activities including marketing of agricultural commodity.

**ES 5.12 Land Tenure:** Land ownership is vested in the state. Farmers hold usufructuary rights, and the rights to a particular piece of land can be passed on by inheritance, sale or rental. The land owned by a particular family is often in fragmented holdings within a varying radius of the village. Islamic inheritance law has resulted in continuous subdivision of existing holdings among family members. The two main customary forms of land tenure are gandu, under which the land right is vested in the family head but the land is worked and its produce shared by all family members, and gayauna, under which the land is worked by the family member who has the right to its use. The gandu is of particular importance as it enables the individual to hold off-farm employment while still enjoying the benefits of agriculture. Land pressures have mounted due to population growth, continual, land accumulation by wealthy individuals, and public requirements (roads, schools, irrigation schemes, etc.)

**ES5.13 Crop Production:** The bulk of agricultural production comes from manually cultivated rainfed crops. Fadama areas contribute substantially to the farmer's income as they produce most of the cash crops, mainly during the dry season. The most important crops produced in the area where rainfall is higher, maize, cowpeas, guinea corn, groundnuts and sweet potatoes are popular.

Intercropping of two or more crops is very common. About 85% of the farmers reported that mixed cropping or intercropping of two or more crops on the same piece of land is highly beneficial as it permits filling-in of a crop which may not have germinated well, increase the average cropping density on the farm and therefore provides better utilization of available soil and allows adjustment to uncertainty in the event that one crop may fail due to unexpected drought, insect pest attack, and other unforeseen environmental events. Farmers start the season by planting food crops first, usually millet, which may have sorghum or other crops subsequently planted with it. For most (87%) farmers interviewed, there appears to be no evidence of any particular rotational system practiced. Rather, the choice of crops mainly depends on the farmer's particular food needs, market conditions, agro climatic conditions and location of fields in relation to their houses.

## Levels of Education

It is evident that the trend of educational development in kano state deliver a sound labour force in the near future. Analysis of educational attainment of the subjects in the region reveals about 46% uneducated persons (Table 5.29 and 5.30). Thus, there is a large size of unskilled labour that possibly relies mainly on agriculture and other unprofessional livelihood activities. This probably partly explains the relatively low cost of labour (less than about #2000/8 work hours) in a day in the area. In fact this scenario is corroborated by Maigari (2012) that the cost of a day man-work (8 hours; 8.00am to 4.00pm) is generally low, ranging from =N=500.00 to =N=2,000.00, while wages and salaries of casual workers ranges from =N=6,000.00 to =N=20,000.00 per month.

## Gender

Gender inequality continues to be linked to various traditional practices of many cultural groups in Nigeria. Many cultures promote the belief that, women do not have an identity of their own but those derive from men. The different ethnic groups engage in practices which degrade and discriminate women. In Nigeria, the belief that male issues are more important than female is rampant. Even in issue of education, some families prefer to educate male child at the expense of the female. This is one of the reasons why illiteracy rate is higher among women than men especially rural dwellers in Nigeria. Studies across gender issues in Nigeria disclosed the following factors as major contributors for the prevalence of gender inequality in the basin: Environmental Factors: the environment in Northern region of Nigeria, in general, and HJKYB in particular is not favourable to the development of women due to the problems of desertification and drought and all these are gradually heighted by the impact of climate change. In the North, men and women play different roles in the family.

## Economic activities and sources of income

A socioeconomic assessment of the project area gives some insight into the social, cultural and economic conditions in the project area. A blend of formal and informal interviews, FGD and stakeholder engagements methods, which include the following, were used to acquire the socio-economic data.

Kano is the commercial and investment hub of Northern Nigeria and probably the largest non-oil and gas economy in Northern Nigeria. The Economy of Kano state is driven largely by commerce, manufacturing and subsistence agriculture. Predominantly however, the population in Kano State and the project area in particular, is engaged in agriculture either as full time or as a vocation, in addition to other livelihood businesses. The sample survey shows agriculture engages up to 70% of the population directly or indirectly. The informal sector is strong and diverse, with numerous Micro, Small and Medium Scale Industries (MSMEs) and the informal sector (hawking, show-shining, cobbler, road-side food vending (especially by women), etc. across all economic activities and across all the local government areas, contributing approximately 60 – 70% of output and employment (Public Consultation views).

Economic activities are mostly farming, commerce/trading, informal businesses such as hawking of processed food by young girls and other forms of street food vending by older females including married women within the settlements, shoe shining by young uneducated youths, water vending etc. On the farm, the men mostly do the tedious jobs of cultivation, making of ridges and irrigation canals for water reticulation and transportation of harvested crops to markets for sale and to home for food, while the women participate in planting, weeding and harvesting. In families that have no active men, the women do all the tasks.

Animal husbandry is not very common and stocks are very few averaging 2-10 per family. Bulls are more common because they serve as farming tools and transporting goods and materials. The bulls used for ploughing on farms also serve as means of income where they are used in ploughing for pay/cash. The children, boys only, attend to the animals mostly while the women household domestic duties including fetching firewood, participating in weeding on farm and harvesting and processing crops for food and for sale at the local markets. The commercial activities are mostly smaller trading with some bigger traders selling grains and animals.

#### ES 5.14 Religion and Believes and Languages Spoken,

**Religion:** A large number of the Hausa population is Muslim practicing Islam, based off the teachings of the prophet Muhammad and the instructions of the Holy book, Qur'an. It is said that the religion was brought to them by traders from North Africa, Mali, Borneo, and Guinea during their trade exchanges, and they quickly adapted the religion. Muslims pray five times a day, fast during the month of Ramadan and strive to make the pilgrimage to the holy land in Mecca.

**Culture and tradition:** The Hausa people have unique cultural practices that have stood the test of time regardless of the colonization of the British. This is attributed to the fact that their political and spiritual leaders did not compromise the standards they were well acquainted with; this is why they still maintain their ways of life t in traditions, belief system, values, religion and economy to date.

Household Composition and Size: Typically a household unit in the study area consists of the Household Head (HHH), and members including wife or (wives because the area is

Polygamous), the children and children of relations, sometimes family friends, all dining from the same pot. The house hold type in many cases is the compound type where more than one family or household (HH) share a compound but eating from different pots. On average, a HH is made up of and average of 5 persons. For the Study area an average HH size was (7.5 members) indicating fairly large family sizes, and about 65% (162 respondents) had more than one wife. This includes younger (male) adults aged 30-40 years. Generally only about 4% of the household were headed by aged females, and this mainly arose from widowhood.

## ES 5.15 Causes of Morbidity and Deaths

The main causes of death in Nigeria in 2019 were neonatal disorders. More specifically, 12.25 percent of all deaths were reported to have been due to neonatal disorders. Other common causes included malaria, diarrheal diseases, and lower respiratory infects. Figure 5.33 shows the distribution of frequency of morbidity and mortality in Nigeria based on causes. Most causes of deaths and morbidity are preventable.

## ES 5.16 Consultations and Stakeholders Engagement and Perception

As a requirement and to be in line with international best practices, consultations were held at different levels and times using a participatory approach in this ESIA process. This is necessary to allow the concerned public/critical stakeholders to be part of the decisionmaking process towards the project development and operation. The process will also serve to ensure fulfillment of the community's expectations for a sustainable and environmentally friendly project development. Public participation in also deliver some beneficial information to the ESIA process that may enhance project benefits and minimizes any inadvertent but adverse outcomes of the project. Thus to make project development and operation transparent, public consultation is necessary, and continuous throughout the life of the project. Stakeholder consultations on the proposed project activities at the very early stage of decision-making may help to prevent or mitigate unexpected negative outcomes such as conflicts and adverse environmental impacts of the project decisions and to enhance the positive outcomes.

The project proponent, HJKYB-TF, the funding Agency (AfDB), the Federal Ministry of Environment and the Nigerian legal system regard consultation as a requirement for project development especially of the magnitude of a watershed. This is because it is Important to notify the stakeholders about the nature, magnitude, and scheduling of the proposed project, thereby eliminating any fears or apprehension.

Information dissemination and consultations with stakeholders, especially the Project Affected Persons (PAPs) means transfer of information from Project proponents to the affected population. It provides an opportunity for all the communities in the areas to raise issues and concerns pertaining to the project, and allow the identification of alternatives and recommendations.

## ES 5.7 Discussion with Stakeholders and Summary of Outcome Conclusion

During the meetings, the general overview of the project was presented to the various stakeholders. In addition, the challenges emanating from the implementation of the project and the support needed from all parties to ensure effective project development and successful implementation were also presented and discussed. A key point mostly pointed out was the fact that the project was designed to benefit the government and the people especially those close to the project site and those downstream of the gorge dam. It was also clarified to the community members the benefits that may accrue to them from the implementation of the project such soil and gully stabilization leading to protection of their farm lands from river bank erosion and other forms of destructions arising from surface run off; introduction of exotic plant species especially the vertiver grass, fruits-bearing economic trees etc. It was also stressed that the proposed watershed management activity may create employment opportunities for the local community during the construction phase and facilitate for them innovative erosion control and management practices to enhance farm productivity and food security. Stakeholders emphasized the need to source for local workforce and labor from qualified personnel within the communities affected should the need arise.

## **ES 6.0 Mitigation/Enhancement Measures**

## **ES 6.1 Introduction**

This chapter identifies and presents the impacts mitigation and enhancement measures arising from the ESIA outlined in the previous chapters. The mitigation measures are guides on what is required to avoid/minimize the likely negative environmental, social and economic undesirable consequences of the project implementation and how to enhance the positive impacts.

The ESIA is an instrument used to identify, predict and assess the likely environmental, climate change and social consequences of a proposed development project in order to ascertain the means through which to avoid, minimize, mitigate, compensate/offset and/or monitor adverse impacts, and increase development benefits. This ESIA therefore assesses the direct, indirect and cumulative impacts of the Challawa Gorge Dam Watershed Management Project in its area of influence; examines project alternatives; and determines

the significance of each of the impacts identified. The ESIA identifies ways of improving project selection, design, siting and implementation in order to avoid or mitigate and manage adverse environmental and social impacts that may arise from the project activities.

The broad approach (and methods) adopted for assessing the impacts of the proposed Challawa Gorge Dam Watershed Management project on the physical, biological and social environments is hinged on the Federal Ministry of Environment ESIA Guidelines and the AfDB guidelines contained the AfDB's revised operational safeguards and sustainability series, Volume 1 - Issue 4 (November 2015). Furthermore, the primary information obtained during field data gathering in the project area (including information gathered from members of affected communities and other stakeholders during consultations), secondary information from existing relevant literatures as well as professional experience and judgments of the multidisciplinary ESIA team formed the bedrock upon which the potential impacts were identified and evaluated. In line with the above, impact assessment was carried out in stages as follows:

- Impact Prediction: this entails prediction of changes to the environment that could result from the proposed watershed management project. The prediction of these changes will be based on the identification of potential interactions between the project and the physical, biological and social resources/receptors.
- Impact Characterization: which entails characterizing/forecasting the nature, scale, extent, duration, frequency of the impacts. Characterization will essentially help to determine the magnitude of impacts and degree of change the impact is likely to have on the receptor.
- Impact Evaluation: this entails determination of the significance of impacts based on the magnitude, value, sensitivity/fragility and recoverability of the affected receptors. This requires an in-depth appraisal of the attributes of potential receptors which has been carried out in the baseline studies and presented in Chapter 5 of this report.

The Chapter also presents the approach adopted for the mitigation of identified impacts and outlines the approach for predicting any residual consequences after the application of mitigation measures. The short-term (preconstruction, construction and decommissioning phases) and the long-term (operational phase) were considered. Provision of the assessment methodology used in evaluating impact significance, considering the impact magnitude and sensitivity of receptors and resources affected, is also outlined.

#### ES 6.2 Impact Assessment Approach and Methods

This section describes the overall approach used for the assessment of impacts. Topicspecific methodologies are described under each section of the impact assessment. The assessment of impacts follows an interactive process involving the following key elements:

• Prediction of potential impacts and their magnitude (i.e., the consequences of the proposed on the natural and social environment);

- Evaluation of the significance of impacts taking into consideration the sensitivity of the environmental resources or human receptors into account;
- Develop mitigation measures to avoid, reduce or manage the impacts or enhancement measures to increase positive impacts; and assess significant residual impacts after applying mitigation and enhancement measures.
- Where significant residual impacts remain, further options for mitigation may be considered and impacts re-assessed until they are as low as reasonably practicable for the Project.

# ES 6.3 Overall Impact Significance Ranking

# **Overall Significance Ranking**

The identified environmental and social impacts are evaluated, categorized and scored according to the criteria defined in Tables 6.1; 6.4. Overall consequence of the project is finally determined using the consequence equation and the criteria in table 6.6.

Project Consequence (Overall Impact Significance) = [(A+B+C+D)] X Likelihood (Z) = Significance evaluation score.

## Approach to mitigation measures

The approach adopted this report for identifying mitigation measures and their significance are based on the following considerations:

- Environmental laws and regulations in Nigeria, with emphasis on permissible limits for waste streams (FMEnv (formerly FEPA), 1991);
- AfDB's and other relevant international requirements;
- Best available Technology for Sustainable Development;
- Feasibility of application of the proposed mitigation measures in Nigeria;
- View and concerns of stakeholders as expressed during extensive consultations carried out during the study.

The essence of developing mitigation measures is to avoid, reduce, remedy or compensate for any adverse impacts identified, and to create or enhance positive impacts including environmental and social benefits. In this regard therefore, mitigation measures are understood to include operational controls as well as management actions. These measures may include:

- changes to the design of the project during the design process (e.g. changing the development approach);
- engineering controls and other physical measures applied (e.g. substation maintenance facilities);

• Operational plans and procedures (e.g. Occupational Health Safety Plans); and the provision of like-for-like replacement, restoration or compensation.

For any impact that is major significance, a change in design, layout or concept is usually required to avoid or minimize it. Impacts evaluated as moderate in importance, specific mitigation measures such as engineering controls or other alternatives may be needed to reduce the impacts to as low as reasonably possible levels. In this case the approach also takes into consideration the technical and financial feasibility of the mitigation measures. Impacts assessed to be of Minor significance are usually managed through best engineering and technical practices and operational procedures. While negligible impacts may require no mitigation action, nonetheless they are usually included in the project design. Mitigation measures are proposed by focusing on such measures that can prevent or minimize undesirable impacts through the design and management of the project.

## ES 6.4 Residual Impact Assessment

Impact prediction considers any mitigation, control and operational management measures that are part of the project design and project plan. A residual impact is predicted to remain once mitigation measures have been designed into the intended activity. The residual effects that may remain after applying the impact mitigation measures have also been discussed for further reduction as possible.

## **ES 6.5 Cumulative Impacts**

# **Defining Cumulative Impacts**

Development of this watershed management project may be happing simultaneously with other developmental activities within and around the Challawa Watershed (project area). When taken together these simultaneous (mutually related or unrelated) projects or programs may generate impacts that will affect the same receptors/resources. Such impacts from all potential outcomes will become cumulative. These impacts are regarded as cumulatively induced from impacts, on areas or resources used or directly impacted by the project, from other existing, planned or reasonably defined developments at the time the risks and impacts identification process is conducted. In general, cumulative Impacts are impacts that act with influences from other projects such that:

- The totality of the impacts is greater than their parts; or
- The sum of the effects attains a threshold level such that the impact becomes significant.

The cumulative impacts that are considered to be relevant in the case of the CHallawa Gorge Dam Watershed Management include the following:

- Accumulative: the overall effect of different types of impacts at the same location. An example would be noise and water pollution effects of the Kano State government's proposed Hydro-electric power generating plant at the Challawa reservoir which has started, impacting the local communities as a nuisance/ disturbance and scaring wildlife from their natural harbitats.
- Interactive: where two different types of impacts (which may not singly be important) react with each other to create a new impact (that might be important) (e.g. water abstraction from a watercourse might exacerbate the consequences caused by increased sediment loading).
- Additive or In-combination: where impacts from the primary activity (i.e. the construction and operation of the Project) are added to impacts from third-party activities, e.g. An example would be noise and water pollution effects of the Kano State government's proposed Hydro-electric power generating plant at the Challawa reservoir which has started, impacting the local communities as a nuisance/ disturbance and scaring wildlife from their natural habitats in addition to the already identified effects of the Challawa Gorge Dam Watershed Mangement Project.

## ES 6.6 Identification of Relevant Development(s)

The cumulative impact assessment focuses on the combined effects of the Project with potential future development in the immediate area around the Project site. The cumulative assessment impacts the potential project in view, depending on the status of other projects and the level of data available to characterize the magnitude of the impacts.

Given the lack of available information regarding such future developments, this assessment follows a generic pattern. It focuses on critical issues and sensitivities for this project and how these might be influenced by cumulative impacts with a combination of other developments. Consultations with local and state authorities and identification of relevant and significant developments via searches of relevant documents provided invaluable assistant in this assessment. The main developments identified are cumulative impacts from other projects within 2km.

## ES 7.0 Environmental and Social Management Plan

An Environmental and Social Management Plan (ESMP) is an important component of an Environmental and Social Impact Assessment (ESIA) as it provides an important tool that can be used to measure and check, in a continuous manner, the efficacy of the mitigation measures and project commitments incorporated in the ESIA to minimize or eliminate identified negative impacts. In addition, the ESMP may also be used to ensure compliance

with statutory requirements, and corporate safety & environmental and social management policies.

The key features of an ESMP, drawing from relevant existing guidelines as well as the Nigerian ESMP guidelines, is that it is applicable to a range of types and scales of projects or developments, from projects with a low level of environmental risk to those with high environmental risk; assumes a broad understanding of the term "environment", that includes the biophysical, social and economic components; includes the enhancement of positive impacts (benefits) as well as the mitigation of negative impacts; and should not be viewed as a prescriptive and inflexible document.

An ESMP is therefore, a tool which ensures continuous assessment of the environmental and social impact of a project operation as well as proactive response to the impacts to reduce their overall effect on the identified environmental parameters. It makes an organization to do the right thing at the right time rather than responding to situations borne out of statutory or legal compulsion. This essential tool is contained in the International Standards Organization (ISO).

In this section, an ESMP is presented to be used throughout the life span of the proposed project in Challawa Gorge Dam, Kano State. This ESMP will facilitate environmental and social management of the proposed project and procedures that are provided to help prevent, avoid or minimize negative environmental impacts that may occur from the project planning phase through construction and operations.

## ES 7.1 Objectives of the ESMP

The ESMP is needed to successfully manage the project's environmental and social performance throughout its lifecycle. It integrates social and ecological management with overall project engineering, procurement, construction, and operations. The ESMP is prepared to achieve the following objectives:

## ES 7.2 Objectives of Environmental and Social Management Plan (ESMP)

The objectives of ESMP for the proposed project are to:

- i. Monitor the project proponent's compliance with all the mitigation measures and commitments in the ESIA report;
- ii. Provide early warning signals on potential environmental changes, so that appropriate actions can be taken to prevent or minimize environmental and social impacts;

- iii. Put in place a sound and cost-effective contingency plan that can be activated for prompt response to any unforeseen occurrence;
- iv. promote environmental and social control in the project implementation in all phases;
- v. Ensure that all relevant stakeholders are well informed about their individual and collective responsibilities;
- vi. Incorporate environmental and social management into the project design and implementation processes;
- vii. Serve as a proxy action plan for social and ecological management for the project;
- viii. Provide a framework for implementing environmental and social commitments (such as mitigation measures identified in the ESIA);
- ix. Prepare and maintain project ecological and social performance records for monitoring and evaluating performance monitoring, audits and non-compliance tracking.

The essence of the ESMP is to encourage and achieve the highest environmental and socioeconomic performance standards, and routinely monitor project functions and activities.

# ES 7.3 The Project Implementation Unit (PIU) will manage the project.

The PIU shall hire and manage contractors; a witness NGO shall be accredited to monitor and evaluate the implementation of the ESMP to a certain extent. The contractors are responsible for the performance of the ESMP. Overall regulatory agencies at the National, State and Local Government levels are accountable for implementing ESMP.

## Project Proponent (HJKYB-TF)

The project proponent is the Hadejia Jama'are Komadugu Yobe Basin Trust Fund. Six riparian States established the body in collaboration with Federal Government in Damaturu in 2006. The Trust Fund is an regional platform for a joint intervention with the support of the Federal Government of Nigeria for augmenting line agencies in addressing land and water resources issues in the KYB. An Executive Secretary heads the HJKYB-TF. A PIU has been constituted with a Project Manager who reports to the Executive Secretary.

## Project Implementation Unit (PIU)

The PIU set up by the HJKYB-TF-AfDB is saddled with the responsibility of project implementation. A Project Manager heads it. Members of the PIU consist of technical experts and environmental, social, and two liaison officers appointed from the Federal and Kano State Ministries of Water Resources.

PIU is responsible for the overall project planning and execution, including preparing bidding documents, hiring project management consultants, EPC contractors, and supervising the works. This approach includes ensuring proper implementation of the environmental and social management measures contained in the ESMP and monitoring. To provide additional oversight, the project PIU will retain the services of the ESIA Consultant to manage the ESMP implementation. The PIU will also invite relevant NGOs to monitor and ensure the adequate performance of the ESMP.

# ES 7.4 The Ministry's HSE Department

The HSE department shall be responsible for ensuring the implementation of management measures during the operation phase (post-commissioning), including audits, compliance monitoring, and preparation of periodic reports required by regulations to the operations.

# ES 7.5 Regulatory Agencies and Other Concerned Authorities

The Federal Ministry of Environment (FMEnv) is responsible for implementing the EIA Act 86 of 1992. Furthermore, the proponent and the affected LGA have specific oversight roles, which they perform under the coordination of the FMEnv. Responsibilities for the ESIA and its implementation are shared between multiple stakeholders, including Ministries of Water Resources (Federal and State) competent authorities, the project implementation unit (PIU), the proponent and the contractors.

# ES 7.6 The Federal Government of Nigeria

# Federal Ministry of Environment

The Federal Ministry of Environment is responsible for the overall environmental policy of the Country. It has the responsibility for ESIA implementation and approval under the EIA Act. It has developed specific guidelines and regulations to protect the environment and promote sustainable development. It will monitor the implementation of mitigation measures when the project commences. And they can issue directives to the project on specific actions related to the environment in the project area. The Ministry involves the States typically and sometimes local governments in this responsibility depending on the particular activity.

# ES 7.7 Kano State Ministry of Water Resources and Environment

The Environment department of the ministry manages both human and industrial waste, protects and conserves the environment, and enforces laws on the environment in the State.

## **ES 7.8 Project Proponent**

HJKYB-TF has the overall management for implementing the Challawa Gorge Dam project. However, the body has delegated the daily implementation operations to the PIU.

## ES 7.9 Kano State Environmental Protection Agency

The agencies are responsible for preparing and updating periodic master plans for the development of environmental science and technology and advise the government of the financial and material required for the implementation of such programs; to establish a mechanism to predict ecological disasters; identify the problems of drainage and sewage systems and carry out measures to improve, protect and remedy their ecosystems, also protection and development of the environment and also ensuring a healthy environment.

# ES 7.8 Kano State Ministry of Transport (KnSMT)

The significant roles of the Ministry are;

\*To formulate and implement effective policies regarding road transportation to ensure that adequate road safety measures are implemented across the State.

\*To coordinate the creation of transportation parks, identification and development of railways and river transportation.

\*To ensure effective and efficient movement of goods and services that will enhance socioeconomic growth throughout the States.

# ES 7.9 Kano State Ministry of Land Survey Housing and Urban Planning (KNSMLSHUP)

The Ministry is vested with the authority of land administration. They are also charged with the survey of state lands, determination of land use and control, compensations, housing policies and urban development. The Ministry is also responsible for the supervision of the PIU, mapping and surveying, registration of title to lands, development and maintenance of open spaces.

# ES 7.10 Local Government Areas (LGAs)

The affected LGAs are involved in the ESIA approval process. According to the national EIA requirement, the LGAs will have representatives in the panel that will review the report and advise the Minister to make decisions on the project.

## **ES 7.11 The Customary District Councils**

The traditional head of Karaye Emirate has an essential role in the project concerning mobilising the community members to support the project, grievance redress, peace and security of personnel, equipment, and facilities to be installed. Close contact and regular consultation shall be maintained with customary chiefs throughout the life of the project.

## ES 7.12 Witness NGO

To enhance transparency and trust from PACs, it is suggested that a witness NGO, recognised and credible in the project area, be retained, through a public proposal and selection process, to provide independent advice, and report on ESMP implementation and management, focusing on consultation activities, corporate social responsibilities/related activities and grievances management. This NGO could be a recognised and credible Human Rights advocacy group or an NGO active in rural, environmental, social or development.

This outside look will ensure that proper procedure and stated ESMP processes are followed, that PACs grievances are well taken care of, and that PACs are treated with fairness. This model of supervision is consistent with best practices nationally and internationally. It will ensure that the process is fair and equitable with net positive benefits for the PACs. It also minimises grievances.

## ES 7.13 Contractor Environmental Manager

Each contractor shall appoint a qualified environmental manager who, after approval by the PIU, will be responsible for daily management onsite and the respect of management measures from the ESMP. This manager will regularly report to the environment and social expert of the PIU during the entire construction period. Contractors must hold all necessary licenses and permits before the work begins. It will occur to provide to the PIU all of the required legal documents, among which the signed agreements with owners, authorisations for borrow pits and temporary storage sites, etc.

## ES 7.14 Communities (Community Liaison Officers)

Leaders and traditional institutions of the affected communities will assist in public sensitisation efforts to advance the implementation of ESMP.

## **ES 7.15 Operational Control Procedures**

Each significant impact identified in the ESIA will have an operational control associated with it that specifies appropriate procedures, work instructions, best management practices, roles, responsibilities, authorities, monitoring, measurement, and record-keeping to avoid or reduce impacts. Operational controls are regularly monitored for compliance and effectiveness through a monitoring and auditing procedure described in the ESMP.

Operational control procedures will be reviewed and, where appropriate, amended to include instructions for planning and minimising impacts or reference relevant documents that address impact avoidance and mitigation.

# ES 7.16 Managing Changes to Project Activities

Changes in the Project may occur due to unanticipated situations. Adaptive changes may also occur during the final design, commissioning or even operations. The Challawa gorge dam management will implement a formal procedure to manage changes in the project that will apply to all project activities.

## ES 7.17 Grievance Mechanisms

During the implementation of the ESMP, disputes/disagreements between the project developer and the PACs may occur. There are significant challenges associated with grievance redress, especially in projects of this magnitude. A grievance procedure based on community grievance resolution channels and regulatory agencies shall be used.

## ES 7.18 Proposed Management Plan

The Environmental and Social mitigation/enhancement measures and the responsibilities for implementation are in Tables 7.2&7.3. The EPC contractor has the responsibility for implementing the mitigation actions during the construction phase. The budget for implementation shall be included in the EPC contract as part of the overall construction cost.

Details of the monitoring plan are presented in the main body of this report and it contains details of responsibilities, parameters to be monitored, monitoring methods and standards/targets, and locations and monitoring frequency. The cost estimates cover costs of analyses of samples (where required), travelling expenses and regulatory costs. The budget for environmental and social monitoring during construction shall be added to the EPC contract budget. The EPC Contractor shall be required to disburse when needed, as may be directed by the Project Manager.

The budget for the monitoring during operations shall be provided by the Ministry's management in its annual budgeting process and administered directly by the appropriate authorities responsible for ensuring mitigation actions are implemented effectively. The Ministry shall adopt these measures and impose contractual conditions during the operation phase of the project. Additional detailed policies and specific plans have been developed to support the implementation. The total estimated cost of implementing the ESMP is one hundred and ninety seven Million, four hundred and Eighty Thousand Naira only (N197,480,000).

#### **ES 8.0 Summary and Conclusion**

This Environmental and Social Impact Assessment (ESIA) Report was prepared in accordance with the requirements of the Federal Ministry of Environment and the African Development Bank (AfDB). Based on interactions between project activities and the recipient environment, the ESIP/ESMP is well documented in this report.

The proposed Challawa Gorge Dam Watershed Management Project by the HJKYB\_TF is justifiable and will have a number of significant positive effects in the short and long term including:

- Reduce Environmental Pollution;
- Minimize global warming and climate change;
- Ensure minimum or no siltation of the Challawa Dam Reservoir which will boost agricultural, commercial, uninterrupted Kano Municipal water supply for domestic and industrial use in the area;
- Stabilize soils and control the menace of gully formation and farm lands destruction around the river banks in the area;
- Contribute to national water resources development and management; and
- Create employment opportunities for the people of the area.

The overall impacts associated with the activities of the proposed project can demonstrably be managed within reasonable and acceptable limits by applying all the recommended mitigation measures.

In addition to the identified mitigation measures, there are a number of other commitments to be followed. These include:

- Undertaking a Best Practicable Environmental Option (BPEO) for the watershed management;
- Define and undertake monitoring for atmospheric emissions, soil loss, sediment influx and social impacts;
- Regular auditing of environmental performance of the project operational elements;
- Carry out further studies to determine the best decommissioning strategy towards the end of the project lifecycle; and

An Environmental and Social Management Plan (ESMP) has also been drawn up to manage residual impacts, ensure compliance with regulatory requirements and the incorporation of environmental controls throughout the project life cycle.

# **ES 8.1 Recommendation**

In view of all that had been documented in this ESIA/ESMP report and the commitment by HJKYB-TF to ensure strict compliance with this ESIA, the Hadeja-Jamaare-Komadugu-Yobe Basin Trust Fund hereby requests the endorsement of the AfDB and the National Regulatory body (FMEnv.) for Approval to enable timely commencement of the proposed project.

#### CHAPTER ONE:

#### INTRODUCTION

#### 1.1 Background

This ESIA Report is a consultancy service commissioned by the Hadejia Jama'are Komadugu Yobe Basin Trust Fund (HJKYB-TF) (the Proponent) as part of requirements to implement its 25 year Strategic Action Plan (2019) with specific reference to Challawa Gorge Dam Watershed Management sub-program out of four priority projects identified by the Agency. The Challawa Gorge Dam Watershed Management project is a priority project the development of which may significantly impact both the bio-physical and human environments of the watershed area.

The African Development Bank (AfDB) in its review of an earlier ESIA report for the project classified it as a class A or II project that may have moderate to adverse impacts and therefore requires full ESIA/ESMP studies. This is supported both by the Environmental Impact Assessment Decree No. 86 of 1992 Laws of Federal Republic of Nigeria, and the Revised 2015 AfDB Environmental and Social Management Assessment Guidelines, which stipulates that:

"Project that is likely to have detrimental site-specific environmental and/or social impacts that are less adverse than those of Category 1 projects and can be minimized by applying appropriate management and mitigation measures or incorporating internationally recognized design criteria and standards .... require an appropriate level of Environmental and Social Assessment (SESA for program operations or ESIA for investment projects) tailored to the expected environmental and social risk so that an adequate ESMP can be prepared in the case of an investment project or an Environmental and Social Management Framework (ESMF) can be designed and implemented by the borrower in the case of program operations to manage the environmental and social risks of sub-projects in compliance with the Bank's safeguards."

Challawa Gorge Dam was built in the early-90s to supply drinking water to Kano State and supply irrigation water for Kano irrigation project. However, recently, watershed degradation has been a serious problem resulting in erosion and sedimentation problems in Challawa Reservoir, threatening the life of the reservoir and making water treatment very costly because of high turbidity. In addition, erosion in the upland watershed is affecting farmers' lands and encroaching towards private property. As a result of this, project scope has been defined to address the problem of erosion and gully formation in the watershed, reservoir sedimentation and problems in the Challawa water works treatment plant through watershed management.

# **1.2 Project Proponent**

The proponent of the project is the Hadeja, Jama'are komadudugu, Yobe Basin Trust Fund (HJKYB-TF). The ESIA/ESMP report presents findings and assessment of the assignment in line with the terms of reference with a work breakdown, and schedule for mobilization, strategy, methodology, quality assurance plan and timetable for the services execution of the consultancy. In addition, the report addresses the Safeguard instruments being prepared, the tasks to be met, the African Development Bank's (AfDB's) requirements, the timeline of the activities and the deliverables.

## **1.3 Purpose of ESIA Report**

The purpose of the ESIA is to assess the potential biophysical and social impacts of the proposed project, which includes a detailed Environmental and Social Management Plan (ESMP). The ESIA will establish modalities of implementing the ESMP under Nigeria Environmental policies and laws and the AfDB ISS.

## 1.4 Objective of the Environmental and Social Impact Assessment

The objective of the assignment is to prepare the Environmental and Social Impact Assessment (ESIA) and Environmental and Social Management Plan (ESMP) in line with the AfDB's Integrated Safeguards Systems policies and adhering to country environmental standards and approved mechanisms for permit issuance. The Consultant is required to undertake an Environmental and Social Impact Assessment (ESIA) and propose an Environmental and Social Management Plan (ESMP) from the generated baseline data. The land acquisition, resettlement, compensation and valuation of land required or affected by the development shall be fully determined by the Consultant including stakeholder consultations and disclosure requirements consistent with the applicable environmental laws and regulations.

For solution to the Challawa Gorge Dam watershed management problem, two main and twelve finger gullies were identified for remediation in two pilot sub watersheds during the preparation of the project plan (SMEC 2019). For the two sub-watersheds namely PSW\_1 and PSW\_2, structural measures are to be provided inside the gullies and bio-remediation Page **3** of **490** 

and agricultural measures to be provided on eroded gully banks and on adjacent farm lands respectively. Gabion check dams and sediment traps are the main structural measures to be constructed; the unstable section of the gullies was designed to be provided with check dams to stabilize flow and promote sediment deposition upstream of the check dams. The Check dams are designed for 10-year return period design floods and their stability is checked for a 25-year return period. Generally, about 50 Gabion check dams differing in size are to be provided in both Pilot sub watersheds (i.e. PSW\_1 and PSW\_2). Gullies with relatively stable slopes are to be provided with embankment filled sediment traps at their outlet locations. Theses sediment traps will serve to trap sediments which come from agricultural land until the agricultural and bio remediation erosion control measures fully develop and reduce sediment. Provision is made for four sediment traps at the outlets of finger gullies in the two pilot sub watersheds. Each sediment trap is equipped with a rock riprap overflow spillway and concrete pipe dewatering orifice. The spillway is designed to pass the 25-year return period design flood while the orifice is designed to empty the 10-year design flood volume in 24 hours.

Furthermore, on eroded banks of gullies and on the adjacent agricultural lands, bioremediation and agricultural erosion control measures shall be provided. Gully banks and steep agricultural lands are proposed to be protected with provision of bio engineering (bioremediation) and agricultural erosion control measures respectively. The main bio engineering measures proposed is planting of vetiver grass. Vetiver grass was proposed on eroded gully banks by trimming and grading steep gully banks prior to planting, while the agricultural measures focus on controlling soil loss from agricultural lands by implementing agricultural practices such as contouring, strip cropping and conservation tillage involving the community and in close consultation with farmers. The other source of sediment for Challawa Gorge Dam Reservoir is from the surrounding adjacent agricultural area and from stream bank erosion in the upland watershed as non-point sources. These non-point sources are treated by providing vegetated buffer zones.

The ESIA study for this project is carried out in a way that meets the ESAP of the AfDB, the Nigerian ESIA standards and International best practices. The ESIA analyzes the environmental and social aspects including land acquisition and resettlement sensitivities in the project area and, through the consideration of alternate project designs, to develop project proposals that avoid or minimize potential adverse environmental and socioeconomic impacts arising from the implementation of the project. The study therefore will present:

 An ESIA study report including drafting a livelihoods restoration plan for the affected subjects. Issues to be addressed include but not be limited to: Soil erosion and sedimentation in the catchment areas where the project sites are located; Flooding and Water-logging issues; Health diseases issues; Fertilizer and pesticide applications; Effects on quality of water in downstream receptors; Involuntary displacement and resettlement of affected population; Soil quality, ground water, biodiversity, waste inventory and management, hydrobiology and aquatic resources as well as COVID-19, HIV/AIDS, Malaria, Typhoid and etc. awareness; and other socioeconomic conditions especially gender issues.

- An Environmental and Social Management Plan (ESMP) to mitigate the negative impacts including resettlement of affected farmers based on the following points;
  - Critical review and analysis all available data and information relating to environmental conditions and sensitivities in and around the proposed Watershed Management intervention areas.
  - m) Carry out complementary environmental investigations through visits and discussions at environmental protection agencies and organizations and at projected development sites.
  - n) Prepare environmental questionnaires aimed at complementing and confirming the available and obtained data and information at the level of farmers and rural community residents, to be applied during the farmer and stakeholder surveys.
  - execute the environmental components of the farmer and stakeholder surveys, and assembly, processing and documentation of results for use in detail assessments and in the separate subsequent environmental impact assessments.
  - p) Prepare watershed specific characterization of existing or potential environmental issues, to serve as a basis and guideline for addressing these as warranted in the preliminary project designs and feasibility assessments.
  - q) Investigate relevant environmental studies in the proposed project area and review critically to incorporate major issues appreciable
  - r) Assess all base line conditions prevailing in and around the project areas and description of pertinent regulations and standards governing environmental quality, health & safety, protection of sensitive areas, protection of endangered species, land uses control, etc.
  - s) Assess the characteristics of the pilot watersheds such as land use/land cover, topography, soils, crop and conservation factors, climatic factors, etc. to study the extent of soil erosion or land degradation.
  - t) Assessment of possible pollution of drainage water from agro-chemicals and the possible effect of reduced base flows on increasing concentrations, and determine the dilution capacity of the receiving water body.

- u) Assess the impacts on flora and fauna of the project area; and assessment of the risks of proliferation of aquatic weeds, crop pests and diseases; and evaluation of any other adverse effects of those not mentioned above, on biophysical and socioeconomic environment of the project area.
- Investigate and describe alternative environmental considerations to major activities of the proposed project including design, technology, construction techniques, operation and maintenance procedures, etc.

## 1.5 Scope of the ESIA/ESMP Study

The aim of the Environmental and Social Impact Assessment (ESIA) is to assess the potential environmental impacts (positive and negative) of the proposed Challawa Gorge Dam Watershed (CGDWM) project and related activities, and to propose an Environmental and Social Management Plan (ESMP) to mitigate the short and long term environmental, Social and Economic challenges arising from the project implementation. The core objective of undertaking the ESIA/ESMP study is to assist HJKYB-TF in its effort to obtain environmental clearance from the Federal Ministry of Environment (FMEnv.) and thus to secure the AfDB's commitment to finance the execution of the Watershed Management Project.

#### **1.6 Justification for the Project**

There are three main problems associated with Challawa Gorge Dam Watershed that started from watershed erosion and gully formation in the upland watershed, sediment deposition and siltation of the reservoir and sedimentation problems associated with Challawa Water Works treatment plant. These three problems are mainly due to watershed degradation in the upper reaches of the Challawa Gorge Dam Watershed. To fix these problems and extend the longevity of the reservoir to realize its purpose is the main justification for the project.

The main objective of the Challawa Watershed Management project is to extend the longevity of the reservoir by reducing the sediment flux into the reservoir through integrated watershed management. This will help to significantly reduce the siltation problem in the Challawa reservoir and also contribute for the soil conservation within the watershed. It will also address the problem of sedimentation at the Challawa Water Works treatment plant.

# 1.7 Summary of the Key Activities Undertaken in Line with the EIA Procedures in Nigeria

An outline of the regulatory requirements carried/to be carried out within the context of Nigerian Regulatory framework are summarized in Table 1.2 below.

| ESIA Step         | Description                                  | Status          | Remark         |
|-------------------|--|-----------------|----------------|
| ESIA registration | This step initiates the ESIA process         | This step has   | See Annexure   |
|                   | providing draft terms of reference, a letter | been satisfied. | 1.1            |

# **1.8 ESIA Report Structure**

The structure of this ESIA report is presented below.

- Executive Summary briefly highlights the main issues considered and reported in the main ESIA/ESMP Report.
- Chapter 1. Introduction Provides a background to the proposed Project and the ESIA and provides information about the Proponent.
- Chapter 2. Policy, Legal and Administrative Framework. The Legal and Regulatory Frameworks within which the ESIA was undertaken were also stated while other environmental legislation, standards and guidelines applicable to the Project were listed.
- Chapter 3. Description of project and justification. It presents the project justification, the need/value and its envisaged sustainability as well as the project development and site/route options considered
- Chapter 4. Baseline conditions of the project environment. The chapter defines the areas of direct and indirect influence of the Project. It describes the biophysical and socioeconomic baseline of the Project's areas of influence and presents the public participation process in the ESIA.
- Chapter 5. Associated and social impact assessment. The chapter the approach and methodology for the impacts assessment process. It identifies and assesses potential Project impacts (biophysical and socioeconomic impacts).
- Chapter 6: Mitigation Measures. This chapter defines relevant mitigation measures to avoid, reduce, compensate or enhance Project impacts (as applicable).
- Chapter 7. Environmental and Social Management Plan (ESMP). It presents the Project ESMP, organizing all mitigation, management and monitoring requirements and management programs.
- Appendices. This section provides support information referenced throughout the ESIA.

## **CHAPTER TWO**

## POLICY, LEGAL AND ADMINISTRATIVE FRAMEWORK

#### 2.1 National (Country) Laws and Legislations:

- The Nigerian constitution: As the national legal order, recognizes the importance of improving and protecting the environment and makes provision for it. Section 20 of the constitution makes it an objective of the Nigerian State "to improve and protect the air, land, water, forest and wildlife" of Nigeria. Nigeria has policy and programme instruments founded on its international, sub-regional and national commitments in the area of environmental protection, Land and water resources administration and management.
- The National Environment Standards and Regulation Enforcement Agency Act, 2007: Administered by the Ministry of Environment, the National Environment Standards and Regulation Enforcement Agency (NESREA) Act of 2007 replaced the Federal Environmental Protection Agency (FEPA) Act of 1999. It is the embodiment of laws and regulations focused on the protection and sustainable development of the environment and its natural resources. Various Legal and Legislative Instruments that are reflected in the laws that require the conduct of an ESIA to ensure that a project complies with existing environmental standards include the Environmental Impact Assessment Act, LFN, 2004; River Basin Development Authorities Act, LFN, 2004; Water Resources Act, LFN, 2004; the National Water Resources Management Policy, 2007; the Nigerian Land Use Act CAP 202 LFN 2004 and the National Resource Conservation Action Plan, 1992 among several other National, State and Local Governments Regulations.
- Federal Environmental Protection Agency (FEPA) Act, 1988 (Decree Nº 58) and amendment Decree Nº 59 of 1992: By this Decree, FEPA was strengthened and transferred to the Presidency and expanded its mandate to include the conservation of biodiversity and sustainable use of Niger preparation of a comprehensive national policy for the protection of the environment and conservation of natural resources, including procedure for environmental impact assessment.
- The Environmental Impact Assessment Decree No. 86 of 1992, Laws of the Federation of Nigeria: The law defines the fundamental principles of environmental protection. The Environmental Impact Assessment (EIA) Act Cap E12, LFN2004 which lays down the operating rules for environmental protection procedure, is one of the implementing instruments of that law which governs the whole Environmental and

Social Impact Assessment (ESIA) process. Decree 86 empowers FEPA and its custodian, to ensure that all major developments including the utilization of water resources are undertaken in a manner that does not result in unacceptable environmental impacts. In essence, the decree requires every major development projects undergoes a FEPA approved EIA process prior to its implementation. It also empowers FEPA to shut down all offending projects and prosecute the operators.

- The National Water Resources Law: The National Water Resources Act, CAP W2, LFN 2004 on the other hand is targeted at developing and improving the quantity and quality of water resources. It vests the right to use and control all surface waters and groundwater and of all water in any watercourse affecting more than one state in the Federal Government. This act is the highest existing legislation governing water resources management in Nigeria. It confers on the Federal Ministry of Water Resources (FMWR) the responsibility for controlling the use of trans-state surface and groundwater resources throughout Nigeria. The Act represents the contemporary approach on water resources development, conservation, allocation and use that aims to optimize and sustain social, economic and environmental needs based on the IWRM approach. The importance of eradicating poverty, improving public health, and enhancing energy and food security and ensuring intergeneration of water security in the face of impending water crisis remains the central water resources development agenda of the Federal Government. The implementation of the Water Act is underpinned by the 2011 Water Sector Roadmap with specific targets for 2025 aligned with the African Water Vision including 100% coverage for water supply and sanitation, achieving the development of 95% of the hydropower potential and extension of irrigation to cover about 3.0 million ha.
- The National Water Resources Bill 2017: The National Water Resources Bill defines the powers and functions of water management institutions, the approach to water resource management and strategy development and definition of the mechanisms and procedures for implementation as well as promoting good governance in the water sector. Once enacted, the National Water Resources Act will replace Water Resources Decree 101 of 1993 and repeal and modify other related laws as defined in Part XIV of the draft National Water Bill. From the federal standpoint there are three pieces of legislations that form the core of water laws and the basis of water law administration throughout Nigeria. The relevant laws are: River basin Development Authority Act, 1976 (1990), Water Resources Act, 1993, and the Environmental Impact Assessment Act, 1992. These laws form the normative core whilst relevant rules and provisions can be found in a variety of sources including

constitutional law, land law, and mining law. The Water Resources Act, 1993 vests ownership of all water courses affecting more than one state of the federation, as well as all underground water throughout the federation in the federal government of Nigeria. By virtue of this law, the waters of all Nigeria's trans-boundary rivers and lakes belong to the federal government. However, the three levels of government, Federal, State and Local, share responsibility for water Resources and environmental management in Nigeria.

- The National Resource Conservation Action Plan,(NRCAP) 1992: The NRCAP, 1992 was concerned to set out objectives for living resources conservation through, maintaining genetic diversity in order to ensure permanence in the supply of materials to satisfy basic human needs and thus improve the well-being of society; promoting the scientific value of natural ecosystems, the study of which is required to enhance conservation itself, to improve the management of man-made systems, and to provide clues to technical innovations in agriculture, medicine and industry; regulating environmental balance in such factors as carbon dioxide and radiation levels and the bio geo-chemical cycles; maintaining ecological services through the protection of catchment's areas in order to enhance water resources and check soil erosion and flooding, protection of grazing lands against desert encroachment and the stabilization of coastal zones and; Enhancing the amenities values of natural resources, including aesthetic, heritage, religious, sentimental, ethical and recreational values on which tourism may be built.
- The River Basin Development Authorities (RBDAs)Decree 1976: The RDBAs came into existence following the promulgation of Decree 25 of 1976. They were conceived as vehicles for attaining a pan Nigerian Programme of water resources development. The current law on RBDAs is the RBDA Act cap 396 Laws of the Federation of Nigeria, 1990. This statute spells out diverse functions and objectives for these Authorities from which it may be inferred that their existence nationwide propels their acceptance as an appropriate unit for water management. Section 4(1) (a)-(d) of the RBDA Act vest the Authorities with the legal powers to undertake comprehensive development of both surface and underground water, to construct and maintain dams irrigation and drainage system, to supply water to all users, and to construct and maintain infrastructural services including roads and bridges across project sites.

• The National Inland Water Act (NIWA ACT CAP N47 LFN 2004): The law establishing NIWA gave it the statutory roles to: Provide regulations for Inland water navigation; Ensure development of infrastructural facilities for a national inland

- waterways connectivity with economic centers using the River Ports and nodal points for inter-nodal exchanges; Ensure the development of indigenous technical and managerial skills to meet the challenges of modern inland waterways transportation; Undertake capital and maintenance dredging; Undertake hydrological and hydrographic surveys; design ferry routes; survey, remove, and receive derelicts, wrecks and other obstructions from in land waterways; operate ferry services within the inland waterways system; Undertake installation and maintenance of lights, buoys and all navigational aids along water channels and banks; Issue and control licenses for inland navigation, piers, jellies, dockyards; Examine and survey inland water crafts and shipyard operators; grant permit and licenses for sand dredging, pipeline construction, dredging of slots and crossing of waterways by utility lines, water intake, rock blasting and removal; Grant licenses to private inland waterway operators; Approve designs and construction of inland river crafts; approve and control all (i) jetties, dockyards, piers within the inland waterways; ii. advertising within the right-of-way of the waterways; (iii) reclaim land within the right-of-way; (iv) undertake the construction, administration and maintenance of inland river-ports and jetties; (v) Provide hydraulic structures for river and dams, bed and bank stabilisation, barrages, groins; Collect river lolls; (vi) Undertake the production, publication and broadcasting of navigational publications, bulletins and notices, hydrological year hooks, river charts and river maps; (vii) Carry out consultancy and contractual services; (viii) Represent the Government of Nigeria at national and international commissions that deal with navigation and inland water transportation; (ix) Subject to the provisions of the Environmental Impact Assessment Act, carry out environmental impact assessment of navigation and other dredging activities within the inland water and its right-of-ways; (x) Undertake erection and maintenance of gauges, kilometer boards, horizontal and vertical control marks; (xi) Advise government on all border mailers that relate to the inland waters; (xii) Undertake acquisition, leasing and hiring of properties; (xiii) Run cruise boats; (xvi) Carry out boat repairs, and (xv) boat construction and dockyard services; and clear water hyacinth and other aquatic weeds.
- National Water Resources Institute (NWRI) Act, 1990: The NWRI enabling law is the NWRI Act, Cap 284 LFN 1990. Section 2, thereof, spells out the Functions of the institute in both general and specific terms. It is empowered to perform Engineering research function related to such major water resources projects as may be required for flood control, river regulation, reclamation, drainage, irrigation, domestic and industrial water supply, sewage and sewage treatment. The institute is further

charged with the performance of other functions related to planning of water resources management and river basin development.

- **The Nigerian Land Use Policy:** The Land Use Act CAP 202 LFN 1990 sets the legal basis for land acquisition and resettlement in Nigeria. It vests land in the Governor of each State, and provides that it shall be held in trust for the use and common benefit of all people. The administration of land is divided into urban and rural land. The urban land is directly under the control and management of the Governor of each State who would hold such Land in trust for the people and would henceforth be responsible for allocation of land in all urban areas to individuals resident in the State and to organizations for residential, agriculture, commercial and other purposes; and non-urban land, which will be under the control and management of the Local Governments.
- National Environmental Standards & Regulations Enforcement Agency (NESREA) Act, 2007: This is an agency under the Federal Ministry of Environment. It was established by Act 25 of 2007. The agency is charged with enforcing regulatory standards relating to the environment.

| Regulation                                       | Description                                      |

## 2.2 The African Development Bank (AfDB) Requirements and Guiding Principle

The guiding principles for the conduct of the ESIA, ESMP and RAP shall include the use of African Development Bank Guidelines and Federal Ministry of Environment legislations. Safeguard instrument for this project shall be prepared pursuant to the requirements of the African Development Bank (AfDB) Integrated Safeguards System (ISS) 2013, and the AfDB Revised Environmental and Social Assessment Procedure (ESAP) 2015, which are the cornerstone of its strategy to promote growth that is socially inclusive and environmentally sustainable. The Banks's Integrated Safeguards System (ISS) has a set of operational safeguards (OS) applicable to the proposed project. These include policies on conduct of Environmental and Social Impact Assessment (OS1), Involuntary Resettlement, Land acquisition, Population displacement, and compensation (OS2), Biodiversity and Ecosystems Services (OS3), Pollution Prevention and Control, Green House Gases, Hazardous Materials and Resources Efficiency (OS4), and Labour Conditions, Health and Safety (OS5) (table 2.1). The AfDB Revised Environmental and Social Impact Studies and reporting.

# 2.2.1 The Integrated Safeguards System (ISS)

The Environmental and Social Safeguards (ESS) of the AfDB form the fulcrum of the Bank's support for inclusive economic growth and environmental sustainability in Africa. The AfDB applies the Integrated Safeguards System (ISS) for all projects. The ISS is designed to promote project outcomes by protecting the environment and people from potentially adverse impacts of projects. The ISS provides that all the projects funded or supported by the AfDB must comply with the ISS requirements during projects preparation and implementation. The aim of the safeguards includes:

- Avoidance of adverse impacts of projects on the environment and affected people while maximising potential development benefits to the extent possible;
- Minimise, mitigate, and compensate for adverse impacts on the environment and affected people when avoidance is not possible; and
- Help borrowers/clients to strengthen their safeguard systems and develop the capacity to manage E&S risks.

The ISS consists of four interrelated components, as summarised in table 2.2.

Table 2.2: Structure of the AfDB ISS

| Integrated Safeguard Policy<br>Statement  | $\rightarrow$ | Declaration of Commitment to environmental- and Social Sustainability.   |
|---|---------------|--|
| Operational Safeguards                    | $\rightarrow$ | Short and focused Policy Statements that follow bank commitments and established operational Parameters.                 |
| ESAP Revised Procedures                   |               | Procedural and Process guidance (documentation,<br>analysis, review and reporting) at each stage of<br>project cycle.    |
| Guidance Notes Revised<br>IESA Guidelines | $\rightarrow$ | Detailed methodological, sectoral and thematic)<br>guidance on Integrated Environmental and Social<br>Impact Assessment. |

# 2.2.2 The Integrated Safeguards Policy Statement

The Policy Statement describes the common objectives of the Bank's safeguards and lays out policy principles. It is designed to be applied to current and future lending modalities. It considers the various capacities and needs of regional member countries in both the public and private sectors. The Integrated Safeguards comprises of Policy Statement that sets out the basic tenets that guide and underpin the Bank's approach to environmental safeguards. The Bank's Integrated Safeguards Policy Statement sets out the Bank's commitments to and responsibilities for delivering the ISS in order to:

- vii. ensure systematic assessment of Environmental and Social impacts and risks;
- viii. apply the Operational Safeguards (OS) to the entire portfolio of Bank operations;
- ix. support clients and countries with technical guidance and practical support in meeting the requirements;
- implement an adaptive and proportionate approach to Environmental and Social management measures to be agreed with clients as a condition of project financing;
- xi. ensure that clients engage in meaningful consultations with affected groups; and to
- xii. Respect and promote the protection of vulnerable groups in a manner appropriate to the African context.

# 2.2.3 The Operational Safeguards (OSs)

The Oss consists of a set of five Operational Safeguards requirements that Bank clients are expected to meet when addressing social and environmental impacts and risks. Bank staff uses due diligence, review, and supervision to ensure that clients comply with these requirements during project preparation and implementation. The OSs is designed to:

- Better integrate considerations of E&S impacts into Bank operations to promote sustainability and long-term development in Africa;
- Prevent projects from adversely affecting the environment and local communities or, where prevention is not possible, minimise, mitigate and compensate for adverse effects and maximise development benefits;
- Systematically consider the impact of climate change on the sustainability of investment projects and the contribution of projects to global greenhouse gas emissions;
- Delineate the roles and responsibilities of the Bank and its borrowers or clients in implementing projects, achieving sustainable outcomes, and promoting local participation; and
- Assist regional member countries and borrowers/clients in strengthening their own safeguards systems and their capacity to manage E&S risks.

| Operational Safeguard   | Description   |
|---|---|
| <b>OS 1:</b> Environmental and social assessment  | This overarching safeguard governs the process of determining a project's environmental and social category and the resulting social and ecological assessment requirements.  |
| OS 2: Involuntary<br>Resettlement: Land<br>Acquisition, Population<br>Displacement and<br>Compensation                | This safeguard consolidates the policy commitments, and requirements<br>set out in the Bank's policy on involuntary resettlement and incorporate<br>a few refinements designed to improve the operational effectiveness of<br>those requirements.   |
| <b>OS 3:</b> Biodiversity and<br>Ecosystem Services   | This safeguard aims to conserve biological diversity and promote the sustainable use of natural resources. It also translates the commitments in the Bank's policy on integrated water resources management into operational requirements.  |
| <b>OS 4:</b> Pollution Prevention<br>and Control, Greenhouse<br>Gases, Hazardous Materials<br>and Resource Efficiency | This safeguard covers the range of critical impacts of pollution, waste,<br>and hazardous materials for which they are aligned to international<br>conventions, as well as comprehensive industry-specific and regional<br>standards, including greenhouse gas accounting, that other multilateral<br>development banks follow. |
| <b>OS 5:</b> Labour Conditions,<br>Health and Safety  | This safeguard establishes the Bank's requirements for its borrowers or<br>clients concerning workers' conditions, rights and protection from abuse<br>or exploitation. It also ensures greater harmonisation with most other<br>multilateral development banks.  |

## Table 2.3: AfDB Operational Safeguards OS1-5

# 2.2.4 Environmental and Social Assessment Procedures (ESAPs)

The Bank's ESAPs details the specific procedures that the Bank and its borrowers or clients should follow to ensure that Bank operations meet the operational safeguards (OSs) requirements at each stage of the Bank's project cycle.

Its adoption and implementation enhance the E&S performance of the Bank's operations and improve project outcomes. The ESAPs will help to improve decision-making and project results by ensuring that Bank-financed procedures conform to the requirements laid out in the operational safeguards (OS) and are thus sustainable. The ESAP describes how the Bank and its borrowers should work together to ensure that environmental, climate change and social considerations are integrated into the project cycle from country programming to post-completion. It represents a coordination mechanism between the Bank, relevant government agencies, and private sector entities. It plays an essential role in building the project's executing Agency's environmental, social and climate change management capacity. The Environmental and Social Assessment procedures apply during the entire project cycle, with differentiated tasks performed, roles and responsibilities for the Bank and its borrowers and clients.

Also, the Bank has an integrated system to ensure its E & S requirements are incorporated effectively into the whole programme cycle, i.e., Integrated Safeguards Tracking System (ISTS). The ISTS constitutes an integral part of the ESAP. Table 2.4 is a summary of the vital requirements of the ESAP during each project stage.

| AfDB Project   | Details  |  |  |  |  |  |
|----------------|--|--|--|--|--|--|
| Cycle          |  |  |  |  |  |  |
|                | • During <b>country programming</b> , the critical task is to develop and update |  |  |  |  |  |
| Country        | baseline data on RMCs' E&S components, policies, programs, and                   |  |  |  |  |  |
| Programming    | capacities to better integrate E&S dimensions into lending priorities.           |  |  |  |  |  |
| Phase          | • These are the responsibilities of the Bank's Sector Departments and            |  |  |  |  |  |
|                | Regional Departments.  |  |  |  |  |  |
|                | • At the project identification phase, the screening exercise focuses            |  |  |  |  |  |
| Project        | on the E&S dimensions of a project to categorise it in one out of four           |  |  |  |  |  |
| Identification | categories based on the potential adverse E&S impacts of the project.            |  |  |  |  |  |
| Phase          | • The Bank and FMENnv will conduct these tasks in collaboration with the         |  |  |  |  |  |
|                | client.  |  |  |  |  |  |
| Project        | • During project preparation, the scoping exercise helps define the              |  |  |  |  |  |
| Preparation    | Environmental and Social Assessments (ESA) scope to be completed                 |  |  |  |  |  |
| Phase          | by the Borrower based on the project category, with staff assistance             |  |  |  |  |  |

Table 2.4: Brief on the AfDBs Project Cycle and E&S Requirements

| AfDB Project              | Details  |
|---------------------------|--|
| Cycle                     |  |
|                           | from the operational departments.  |
|                           | • The preparation of these assessments, including the development of           |
|                           | management plans and systems, requires consultations with primary              |
|                           | and secondary stakeholders.  |
|                           | Once ESAs are finalised, the review process allows operational                 |
|                           | departments to ensure that Bank's vision, policies, and guidelines were        |
|                           | adequately considered in project design and implementation.                    |
|                           | • The clients/borrower will prepare the required studies and plans, while      |
|                           | the Bank will review and validate them.  |
|                           | • During the appraisal phase, ESIA Summaries shall be reviewed and             |
|                           | cleared by the Safeguards and Compliance Department.                           |
|                           | • The procedures require the public disclosure of summaries under              |
| Project                   | specified deadlines.   |
| Appraisal                 | $\circ$ All Category one (1) operations shall be disclosed for 120 days        |
| Phase                     | before Board deliberations.  |
| T Huse                    | $\circ$ All category two operations shall be disclosed for 30 days before      |
|                           | Board deliberations.   |
|                           | • The Bank will conduct site visits and verification activities concerning the |
|                           | borrowers' studies, plans, and systems.  |
|                           | • At the project implementation phase, the Borrowers shall ensure the          |
|                           | implementation of E&S management plans developed to address                    |
| Brainat                   | adverse impacts while monitoring the project impacts and results.              |
| Project<br>Implementation | • The Bank's operational staff shall supervise the Borrowers' work and         |
| Phase                     | verify compliance through supervision missions, and E&S audits                 |
| FIIdSe                    | whenever necessary.  |
|                           | • Audits are undertaken during the completion phase, and post                  |
|                           | evaluations shall also aim to assess the E&S sustainability of the results.    |

# 2.3 State Laws and Legislations:

The Nigerian Constitution allows States to make legislations, laws and edicts on the environment. The FEPA Amendment Act No. 58 of 1988 also recommends the setting up of State Environmental Protection Agencies (SMENV) to participate in regulating the consequences of project development on the environment in their areas of jurisdiction. The SMENVs thus have the responsibility for environmental protection within their states. In accordance with the provisions of Section 24 of FEPA Act 58 of 1988 (Cap 131 LFN 1990) the Kano State Environmental Protection Agency Edict was enacted. The edict empowers the State Environmental Protection Agency (SEPA) "to establish such environmental criteria, guidelines/specifications or standards for the protection of the state's air, lands and waters

as may be necessary to protect the health and welfare of the people." The SEPAs are empowered to undertake functions that include, routine liaison and ensuring effective harmonization with the FMEnv in order to achieve the objectives of the National Policy on the Environment; co-operate with the FMEnv and other relevant regulatory agencies in the promotion of environmental education; be responsible for monitoring compliance with waste management standards; and to monitor the implementation of the EIA and Environmental Audit Reports (EAR) guidelines and procedures on all developmental policies and projects within the State:

- Kano State Legislations: The relevant Kano State Institutions charged with issues on environment include the State Environmental Protection Agency (KSEPA); the Kano State Rural Water Supply & Sanitation Agency (RUWASA) backed by the Kano State Environmental Sanitation Laws of 1985 and 2000; Kano State Public Health Law of 1999; and the Kano State Environment Pollution Control Law of 1985. The Kano State Environmental Protection Agency and the State Ministry of Environment are important stakeholders in the proposed Challawa Gorge Dam Watershed project. Other State Water Edicts and byelaws also form the legal basis and authority for water use and management as far as they relate to intrastate watercourses and water bodies. The present set up in Nigeria is such that virtually every state of the federation has a State Water Agency with its enabling laws. These agencies deal with individual aspects of water use to serve individual sectors of the economy.
- Local Level: At the local government level, customary laws on water use can be as important and binding as any written enactment in regulating water resources related activities especially at the level of rural community. A universally accepted principle is that all persons belonging to the community have a right to use water passing through the community. The water right so possessed by all is, however subject to reasonable use. Reasonable right entails ensuring that the quality of water is preserved.

### 2.4 AfDB Project Categorization Process

The ESAP also includes procedural requirements such as categorising projects, disclosing and monitoring projects during implementation and operation. All AfDB financed projects will be categorised and structured to meet AfDB ISS requirements. Under AfDB ISS, each project undergoes E&S appraisal to determine a project funding feasibility as well as ensuring that the E&S considerations are incorporated effectively in the planning, implementation, and operation of the projects. Each subproject will undergo **initial E&S screening** and be categorised accordingly at the initial stage of the project cycle to determine the nature and level of E&S investigations, information disclosure and stakeholder engagement required. The categorisation is done according to the guidelines stipulated in the AfDB ESAPs.

Based on the categorisation, the projects will then be subjected to an appropriate E&S assessment and mitigation measures will be formulated to ensure E&S considerations are incorporated in the course of the project's implementation. Table 2.5 summarises AfDB's project categorisation process (detailed in the ESAP).

| Table 2.5: AfDB | Project | Categorization | Process |
|-----------------|---------|----------------|---------|
|-----------------|---------|----------------|---------|

| AfDB Project Category | Description  |
|-----------------------|--|
|                       | Projects likely to cause significant E&S impacts.                |
|                       | • Category 1 projects are likely to induce significant and       |
| Category 1            | irreversible adverse environmental and social impacts or         |
|                       | significantly affect social or ecological components that the    |
|                       | Bank or the borrowing country considers sensitive.               |
|                       | Projects are likely to cause less adverse E&S impacts than       |
|                       | Category 1.  |
|                       | • Category 2 projects are likely to have detrimental site-       |
|                       | specific environmental and social impacts that are less          |
| Category 2            | adverse than those of Category 1 projects.                       |
|                       | • Likely impacts are few, site-specific, largely reversible, and |
|                       | readily minimised by applying appropriate management and         |
|                       | mitigation measures or incorporating internationally             |
|                       | recognised design criteria and standards.                        |
|                       | Projects with negligible adverse E&S risks                       |
|                       | • Category 3 projects do not directly or indirectly affect the   |
|                       | environment adversely and are unlikely to induce adverse         |
|                       | social impacts. They do not require an E&S assessment.           |
| Category 3            | Beyond categorisation, no action is required.                    |
|                       | • Nonetheless, to design a Category 3 project properly, it may   |
|                       | be necessary to carry out gender analyses, institutional         |
|                       | analyses, or other studies on specific, critical social          |
|                       | considerations to anticipate and manage unintended               |
|                       | impacts on the affected communities.                             |
|                       | Projects involving lending to financial intermediaries (FI).     |
|                       | Category FI projects involve lending to financial                |
| Category FI           | intermediaries that on-lend or invest in projects that may       |
|                       | produce adverse E&S impacts.                                     |
|                       | • FI include banks, insurance, reinsurance and leasing           |
|                       | companies, microfinance providers, private equity funds          |

|                  | and investment funds that use the Bank's funds to lend or         |
|------------------|---|
|                  | provide equity finance to their clients.                          |
|                  | • The financial intermediary's portfolio is considered high risk. |
| Subcategory FI-A | It may include projects with potentially significant adverse      |
| Subcategory FI-A | environmental, climate change, or social impacts and are          |
|                  | equivalent to Category 1 projects.                                |
|                  | • The financial intermediary's portfolio is deemed to be          |
| Subastagary ELP  | medium risk. It may include projects with potentially limited     |
| Subcategory FI-B | adverse environmental, climate change, or social impacts          |
|                  | equivalent to Category 2 projects.                                |
|                  | The financial intermediary's portfolio is considered low risk     |
| Subcategory FI-C | and includes projects with minimal or no adverse                  |
|                  | environmental or social impacts that are equivalent.              |

### 2.5 International Protocols and Agreements on Water and Sustainable Environment

It is reckoned that in many parts of the world, cooperative arrangements for trans-boundary rivers, lakes and aquifers are lacking or too weak to deal with growing water-related challenges. Therefore, establishment and/or strengthening governance arrangements for these waters is considered necessary in providing the enabling environment for integrated water resources management (IWRM) and investment, and to allow riparian countries reap the numerous shared benefits that trans-boundary cooperation can offer. In support of this, countries including Nigeria became a Party to the United Nations global water conventions, i.e. the Convention on the Protection and Use of Trans-boundary Watercourses and International Lakes (Water Convention), and the Convention on the Law of the Non-Navigational Uses of International Watercourses (Watercourses Convention). The Water Convention aims to protect and ensure the quantity, quality and sustainable use of transboundary water resources by facilitating cooperation. It provides an intergovernmental platform for the day-to-day development and advancement of trans-boundary cooperation. Initially negotiated as a regional instrument, it turned into a universally available legal framework for trans-boundary water cooperation, following the entry into force of amendments in February 2013, opening it to all UN Member States, Nigeria inclusive.

There are several international agreements relevant to the water resources and environment to which Nigeria is a signatory. These agreements attempt to regulate how governments relate to each other on a host of issues. Trade agreements are among the most common types of international agreements that contribute to international agricultural law. Apart from the National Laws, Acts and Regulations, Nigeria is a signatory or party to many International Environmental Conventions and Treaties relevant to the water and environment sectors. Some of the relevant International Conventions and Treaties ratified by the Government of the Federal Republic of Nigeria are presented in table 2.6.

| Table 2.6: Project   | Relevant | International | Agreements | and | Conventions | to | Which |
|----------------------|----------|---------------|------------|-----|-------------|----|-------|
| Nigeria is a Signato | ory      |               |            |     |             |    |       |

| S/N | Regulations  | Year    |

|     | Nations (FAO)  |         |

### 2.6 Institutional Framework

This section describes the leading institutions that are relevant to the formulation, monitoring implementation and monitoring of the resources Management at all levels. Institutional gaps and capacity constraints identified are also discussed in section 2.7.2 of this chapter. Relevant Institutions for Water Resources and Environmental Conservation

The Federal Government of Nigeria has established institutional frameworks at the national and river basin levels and at the state level with responsibilities for policy making, implementation, operation and monitoring at the federal and River Basin levels. The relevant institutions with a mandates in the various aspects of water resource development and environmental conservation are briefly discussed as follow:

- **The National Council on Water Resources:** this is the top-most water resources policy formulating body in Nigeria.
- The Federal Ministry of Water Resources (FMWR): it is responsible for implementation of federal water policies in Nigeria. The Federal Ministry of Water Resources is the major government agency that has the statutory responsibility for policy formulation and coordination for water resources development and management throughout the country. However, due to the dependence of other sectors of the economy on this critical resource, as well as the three-tier system of government which Nigeria operates several other statutory and none statutory institutions are active players in the management of water resources. These include Federal Ministry of Environment; the Nigerian Inland Water Ways Authority (NIWA), the Hadeja-Jama'are River Basin Development Authority (HJRBDA), Chad Basin Development Authority, the governments of Kano, Katsina, and Kaduna States (as riparian states to the Challawa Gorge Dam project) through their State level ministries in charge of water resources and environment, etc. Two governmental institutions, namely Federal Ministry of Water Resources and Federal Ministry of Environment are actively involved in water resources management. The HJKYB-TF is also actively involved in the overall management of the Challawa Basin water resources. Furthermore, there are overlaps in the roles and mandates of the various governmental institutions in the basin.
- The Nigeria Integrated Water Resources Management Commission (NIWRMC) under the FMWR is saddled with the responsibility of water regulation, regulation, allocation and management through catchment management programmes at river basins.
- **The Federal Ministry of Environment**. this is the mother organ of government charged with the responsibility for management and protection of the nation's environment. It is responsible for setting up of Environmental guidelines, standards, and regulations on the country's environmental protection.
- The National Inland Waterways Authority (NIWA), hitherto Inland Waterways Department (IWD) of the Federal Ministry of Transport, metamorphosed into an Authority vide an act of the National Assembly, CAP 47, Laws of the Federation of Nigeria (LFN), 2004 (Decree No. 13 of 1997), established with the primary responsibility to improve and develop Nigeria's inland waterways for navigation. It committed to making Nigerian Waterways Navigable & Safe.

The law establishing NIWA gave it the following statutory roles:

- \* Provide regulation for inland water navigation;
- Ensure development of infrastructural facilities for a national inland waterways connectivity with economic centers using the River Ports and nodal points for inter-nodal exchanges;
- Ensure the development of indigenous technical and managerial skills to meet the challenges of modern inland waterways transportation;
- There are several other functions and powers of the authority properly enunciated and documented in laws establishing NIWA (NIWA ACT CAP N47 LFN 2004)
- \* undertake capital and maintenance dredging;
- \* undertake hydrological and hydrographic surveys:
- **\*** design ferry routes:
- survey, remove, and receive derelicts, wrecks and other obstructions from in land waterways;
- \* operate ferry services within the inland waterways system;
- undertake installation and maintenance of lights, buoys and all navigational aids along water channels and banks;
- \* issue and control licenses for inland navigation, piers, jellies, dockyards;
- \* examine and survey inland water crafts and shipyard operators;
- grant permit and licenses for sand dredging, pipeline construction, dredging of slots and crossing of waterways by utility lines, water intake, rock blasting and removal;
- \* grant licenses to private inland waterway operators;
- \* approve designs and construction of inland river crafts;
- **The Nigeria Hydrological Services Agency**: this is the agency of federal government with mandate for water resources data collection, monitoring and evaluation.
- **The Federal Ministry of Agriculture and Rural Development**: is responsible for promoting agricultural development and management of related national resources.
- State Ministries: at the state level, ministries and departments having parallel structures as those at the federal levels are also responsible for setting up states policies and follow-up implementation within the States boundaries. The State Ministries of Water Resources are, for example, responsible for policy, investment and provision of water supply and sanitation within their state.
- The Hadejia-Jama'are River Basin Development Authority (HJRBDA) is the relevant Federal Agency responsible for implementing Federal Government policies or projects on Water Supply and Irrigation and development of related water infrastructure in the river basin. It operates and maintains facilities and Projects, and supervises them within the jurisdiction of the River Basin. The HJRBDA is also responsible for the operation of

the Challawa Gorge dam and the Tiga dam, and all the associated irrigation schemes. The HJRBDA reports to the Federal Government's MWR, Irrigation and Drainage Department.

- Nigeria Integrated Water Resources Management Commission (NIWRMC): It was established and charged with the mandate for issuing water use permits and regulations. NIWRMC consists of a central coordinating body and Catchment Management Offices (CMOs) at eight (8) hydrological areas.
- The National Environmental Standards and Regulations Enforcement Agency (NESREA): it is the agency in Nigeria responsible for elaborating and enforcing compliance with provisions of international agreements, protocols, conventions and treaties on the environment. NESREA has two National Environmental Reference Laboratories located in Kano and Port-Harcourt cities. As for water pollution, NESREA has promulgated the National Environmental (Surface and Groundwater Quality Control) Regulation, 2011.
- The Hadejia-Nguru Wetlands Conservation Programme: the Hadejia-Nguru Wetlands Conservation Programme, which is based in Nguru, advocates the sustainable management of the water resources of the basin, with a more specific concern for maintaining the Hadejia-Nguru wetlands' economic functions and ecological values. It advocates the release of water from upstream dams for downstream ecological and economic uses.
- *Water Use Associations:* there are several Water User Groups/Associations in the HJKYB basin area. These associations manage water abstraction for irrigation mainly by constructing canals and dykes as their focal points. The associations also serve as platforms for sourcing farm inputs like fertilizers from the government.
- The committee for the survival of the river Yobe basin: constitutes opinion leaders of farmers, herders, civil servants, traditional rulers and fisher folks who originate or live downstream of wetlands. The association is a pressure group that is concerned with ensuring that water is made available for downstream communities through advocacy and execution of physical works.
- Local Government Authorities: a total of 29 local Government Authorities, all of which have a domain in the basin, are in one or other way involved in the uncontrolled abstraction of water for small irrigation purposes in the downstream part of the basin.
- State Ministry of Environment/ State Environmental Protection Agency: these agencies formulate the policies and regulations or standards and implement programs for environmental control and management at the State level.
- HJKYB-Trust fund: in light of the scattered responsibilities related to water and the biting challenges in the KY Basin, the KYB Trust Fund was formulated by the six riparian states in 2006 and started its function in May 2007. The Trust Fund was formed with the

principal aim of coordinating and sharing available water and land resources in the basin in an equitable, efficient and sustainable way among all stakeholders. It is practicing several elements of IWRM Principles, capacity building and funding in the basin.

# 2.6.1 Federal Ministry of Water Resources (FMWR)

The Ministry of Water Resources was created to provide sustainable access to safe and sufficient water to meet the cultural and socio-economic needs of all Nigerians in a way that will enhance public health, food security and poverty reduction, while maintaining the integrity of fresh water ecosystem of the nation. Mandates of the Ministry include:

- Formulation and implementation of Water Resources Policy Programme;
- Development and support for irrigated agriculture for food security;
- Collection, storage, analysis and dissemination of hydro-meteorological and hydrological data;
- Monitoring and evaluation of projects and programmes for effective performance;
- Supply of adequate and potable water for domestic and industrial uses;
- Provision of adequate sanitation and maintenance of water quality
- Exploration and development of undergrounded water resources;
- Formulation and review, from time to time, of National water legislation;
- Liaison with all relevant national and international agencies on all matters relating to water resources development; and support of studies and research on the nation's underground and surface water resources potentials.

The ministry is also charged with the responsibility to develop and implement policies, projects and programmes that will enable sustainable access to safe and sufficient water to meet the social, cultural, environmental and economic development needs of all Nigerians. Thus it is the vehicle for the country's integrated water resources management, contributing optimally to the socioeconomic activities of the nation, facilitating and creating enabling environment for integrated conservation, development, management of various water uses for preservation of freshwater ecosystem, adequate access to safe water and sanitation, production of sufficient food and provision of employment opportunities.

## 2.6.2 Federal Ministry of Environment (FMEnv)

The Federal Ministry of Environment was established in 1999 to ensure effective coordination of all environmental matters, which were fragmented and scattered among different line ministries before. The creation of the FMEnv was intended to ensure that environmental matters are adequately addressed in all developmental activities in the country. In line with the above and in accordance with the administration's policy the Ministry exercises the following mandates, to:

- Prepare a comprehensive National Policy for the protection of the environment and conservation of natural resources, including procedure for environmental impact assessment of all developing projects.
- Advise the Federal Government on National Environmental Policies and priorities, the conservation of natural resources and sustainable development and scientific and technological activities affecting the environment and natural resources.
- Prescribe standards for and make regulations on water quality, effluent limitations, air quality, atmospheric protection, ozone protection, noise control as well as the removal and control of hazardous substances.
- Monitor and enforce environmental protection measures.

Some of the Laws, Policies and Regulations under the Federal Ministry of Environment include the following:

- 1. Environmental Impact Assessment Act;
- 2. The Land Use Act;
- 3. Harmful Waste (Special Criminal Provisions) Act;
- 4. Hydrocarbon Oil Refineries Act;
- 5. Associated Gas re-injection Act;
- 6. The Endangered Species Act;
- 7. Sea Fisheries Act;
- 8. Inland fisheries Act, CAP L10
- 9. Territorial Waters Act;
- 10. Nuclear Safety and Radiation Protection Act;
- 11. Quarantine Act;
- 12. River Basins Development Authority Act;
- 13. Pest Control of Production (special powers) Act;
- 14. Agricultural (Control of Importation) Act;
- 15. Water Resources Act;
- 16. Federal National Park Act;

- a. Environmental Impact Assessment (Eia) Act. Cap E12, LFN 2004. An Environmental Impact Assessment (EIA) is an assessment of the potential impacts whether positive or negative, of a proposed project on the natural environment: The E.I.A Act, as it is informally called, deals with the considerations of environmental impact in respect of public and private projects.
  - o Sections relevant to environmental emergency prevention under the EIA include:-
  - Section 2 (1) requires an assessment of public or private projects likely to have a significant (negative) impact on the environment.
  - Section 2 (4) requires an application in writing to the Agency before embarking on projects for their environmental assessment to determine approval.
  - Section 13 establishes cases where an EIA is required and
  - Section 60 creates a legal liability for contravention of any provision.
- **b.** Harmful Waste (Special Criminal Provisions) Act Cap H1, LFN 2004: The Harmful Waste Act prohibits, without lawful authority, the carrying, dumping or depositing of harmful waste in the air, land or waters of Nigeria. The following sections are notable:
  - Section 6 provides for a punishment of life imprisonment for offenders as well as the forfeiture of land or anything used to commit the offence.
  - Section 7 makes provision for the punishment accordingly, of any conniving, consenting or negligent officer where the offence is committed by a company.
  - Section 12 defines the civil liability of any offender. He would be liable to persons who have suffered injury as a result of his offending act.
- **c.** Hydrocarbon Oil Refineries Act, Cap H5, LFN 2004: The Hydrocarbon Oil Refineries Act is concerned with the licensing and control of refining activities. Relevant sections include the following:-
  - Section 1 prohibits any unlicensed refining of hydrocarbon oils in places other than a refinery.
  - Section 9 requires refineries to maintain pollution prevention facilities.
- **d.** Associated Gas Re-Injection Act, Cap 20, LFN 2004. The Associated Gas Re-Injection Act deals with the gas flaring activities of oil and gas companies in Nigeria. The following sections are relevant to pollution prevention:-
  - Section 3 (1) prohibits, without lawful permission, any oil and gas company from flaring gas in Nigeria.
  - Section 4 stipulates the penalty for breach of permit conditions.

- e. The Endangered Species Act, Cap E9, LFN 2004: This Act focuses on the protection and management of Nigeria's wildlife and some of their species in danger of extinction as a result of overexploitation. These sections are noteworthy:
  - Section 1 prohibits, except under a valid license, the hunting, capture or trade in animal species, either presently or likely to be in danger of extinction.
  - Section 5 defines the liability of any offender under this Act.
  - Section 7 provides for regulations to be made necessary for environmental prevention and control as regards the purposes of this Act.
- f. Water Resources Act, Cap W2, LFN 2004: The Water Resources Act is targeted at developing and improving the quantity and quality of water resources. The following sections are pertinent:
  - Section 5 and 6 provides authority to make pollution prevention plans and regulations for the protection of fisheries, flora and fauna.
  - Section 18 makes offenders liable, under this Act, to be punished with a fine not exceeding N2000 or an imprisonment term of six months. He would also pay an additional fine of N100 for everyday the offence continues.
- g. Sea Fisheries Act, Cap S4, LFN 2004: The Sea Fisheries Act makes it illegal to take or harm fishes within Nigerian waters by use of explosives, poisonous or noxious substances. Relevant sections include the following:-
  - Section 1 prohibits any unlicensed operation of motor fishing boats within Nigerian waters.
  - Section 10 makes destruction of fishes punishable with a fine of N50,000 or an imprisonment term of 2 years.
  - Section 14 (2) provides authority to make for the protection and conservation of sea fishes.
- h. Inland Fisheries Act, Cap I10, LFN 2004. Focused on the protection of the water habitat and its species, the following sections are instructive:
  - Section 1 prohibits unlicensed operations of motor fishing boats within the inland waters of Nigeria.
  - Section 6 prohibits the taking or destruction of fish by harmful means. This offence is punishable with a fine of N3, 000 or an imprisonment term of 2 years or both.

i. Mineral Oil Safety Regulations And Crude Oil Transportation And Shipment Regulations. These Regulations prescribe precautions to be taken in the production, loading, transfer and storage of petroleum products to prevent environmental pollution.

## j. Petroleum Products And Distribution Act, Cap P12, LFN 2004.

Under this Act, the offence of sabotage which could result in environmental pollution is punishable with a death sentence or an imprisonment term not exceeding 21 years.

**k.** Territorial Waters Act, Cap T5, LFN 2004: The Territorial Waters Act makes punishable any act or omission committed within Nigerian waters which would be an offence under any other existing law.

## I. Nuclear Safety And Radiation Protection Act, Cap N142, LFN 2004.

The Act is concerned with the regulation of the use of radioactive substances and equipment emitting and generating ionizing radiation. In particular:

- Section 4 provides authority to make regulations for the protection of the environment from the harmful effects of ionizing radiation.
- Section 15 and 16 makes registration of premises and the restriction of ionizing radiation sources to those premises mandatory.
- Section 37 (1) (b) allows an inspector verify records of activities that pertain to the environment.
- Section 40 clarifies that the same regulations guiding the transportation of dangerous goods by air, land or water should also apply to the transportation of radioactive substances.
- **m.** Quarantine Act, Cap Q2, LFN 2004. The Quarantine Act provides authority to make regulations for preventing the introduction, spread and transmission of infectious diseases such as cholera, yellow fever, typhus, etc.

Under this Act, violation of any regulation is punishable with a fine of N200 or an imprisonment term of 2 years or both.

- **n.** River Basins Development Authority Act, Cap R9, LFN 2004. The River Basins Development Authority is concerned with the development of water resources for domestic, industrial and other uses, and the control of floods and erosion.
- o. Pest Control Production (Special Powers) Act, Cap P9, LFN 2004. The Pest Control of Production Act is concerned with export produce conditions and pest control. In particular:

 Section 1 provides an inspector authority to take emergency measures to control pest infestation of produce. p. Agriculture (Control Of Importation) Act, Cap A93, LFN 2004. The Agriculture Act and its Plant (Control of Importation) Regulations are concerned with the control of the spread of plant diseases and pests.

Worth noting is:

- Section 6 which allows authorized officers to take emergency control measures, and provides for the recovery of costs and expenses incurred by the officers in controlling the situation.
- **q.** Animal Diseases (Control) Act, Cap A17, LFN 2004. The Animal Disease (Control) Act makes it an offence to import any animal, hatching egg or poultry into Nigerian except under a permit. The following sections are relevant:

Section 5 provides an inspector with the authority to take emergency measures where necessary.

- Section 10 stipulates penalties for contravening any regulation.
- Section 13 requires owners of trade animals to possess a movement permit and ensure the fitness of their animals.
- Section 20 provides authority to make regulations that prevent and control the spread of animal diseases.
- r. The Federal National Parks Act, Cap N65, LFN 2004: The National Parks Act is concerned with the establishment of protected areas used for resource conservation, water catchments protection, wildlife conservation and maintenance of the national ecosystem balance.

# s. OTHER LEGISLATION:

- Environmental Sanitation Law: This is a law of Lagos State focused on environmental sanitation and protection. It punishes in varying degrees acts like street obstruction, failure to clean sidewalks, cover refuse bins or dispose wastes properly.
- Environmental Pollution Control Law: Section 12 of this law under the Laws of Lagos State makes it an offence to cause or permit a discharge of raw untreated human waste into any public drain, water course or onto any land or water. This offence is punishable with a fine not exceeding N100, 000 (One hundred thousand naira) and in the case of a company, a fine not exceeding N500, 000.

# 2.6.3 HJKY Basin Trust Fund (HKJYB-TF)

The Federal Government (represented by FMWR), in cooperation with the riparian States, established the Trust Fund at the Damaturu Summit in year 2006. The Trust

Fund is an innovative platform for a joint intervention by the riparian states, with the support of the Federal Government of Nigeria for augmenting line agencies in addressing land and water resources issues in the KYB. Riparian state Governors contributed the equivalent of USD 6.5 million to establish the Trust Fund. The Federal Government of Nigeria matched these funds, bringing the total amount available to establish and operate the Trust Fund to some USD 13 million.

The Governors of riparian states, in their May 2017 Summit, renewed their commitment to financially support the Trust Fund, but only FMWR and the Yobe State Government have actually disbursed their part of the pledged funds. Other state governments have approved the pledges but are yet to release funds. However, a new Board of Trustees (BOT) of the Trust Fund has been inaugurated in November 2017. During their recent meeting in April 2018, the Board undertook to persuade the remaining State Governors to provide the funds they pledged as soon as possible.

#### 2.6.4 The Hadejia–Jama'are River Basin Development Authority

The Hadejia Jama'are River Basin Development Authority (HJRBDA) was created in 1976 along with ten other River Basin Development Authorities by the Federal Government of Nigeria under Decree 25 of 1976. Presently, the HJRBDA has the largest functional irrigation schemes among the twelve River Basin Development Authorities in Nigeria. The Authority covers an area of 45,000 km<sup>2</sup> (the entire area of Kano and Jigawa states, and about two-thirds of Bauchi State) with an irrigation development potential of about 240,000 hectares within the Hadejia and Jama'are River Basin. The Headquarters of the HJRBDA are located in Kano City. The HJRBDA is responsible for the development of surface and groundwater resources for irrigated agriculture, water supply and other uses within its catchment area in Kano, Jigawa and Bauchi States. The HJRBDA has continued to develop and manage dams and irrigation projects since its establishment. These projects have a significant impact on the lives of people in its catchment area and beyond. Currently the HJRBDA has developed only 22,324 ha of irrigated land out of a potential area of 240,000 ha, which is very low progress (10.3%)<sup>3</sup>. The financial performance of the HJRBDA has been declining in recent years, and it is expected that the mandate, roles and organization of the HJRBDA will change once the forthcoming Water Bill becomes law.

#### 2.6.5 State Level

The institutional arrangements at state level in the KY Basin in general are as presented below.

#### i. Borno State:

The institutional framework includes the Ministry of Water Resources and State water agencies; Borno Irrigation Department in the Ministry of Agriculture and Natural Resources, and Ministry of Environment. In addition to state executive governor's directives, the Borno State Water Corporation Edict No. 2 (1999) regulates domestic water supply. The State Water Resources Edicts do not clearly define roles and responsibilities for the various State water agencies, with the result that available water quantity is not sustainably managed in the State.

## i. Yobe State

The Ministry of Water Resources and State Water Board, Ministry of Agriculture and Natural Resources, and the Ministry of Environment are major managers of water resources in the Yobe State. The state activities on water issues are based on "Water supply and Sanitation policy (January 2010) and executive governor's directives. Roles and responsibilities of the various MDAs involved in managing the waters of the Lake Chad basin are not clearly defined in terms of control, monitoring and enforcement measures on water use in the State. No water resources law in the State to complement the sustainable water charter of HJKYB-TF. Hence, available water quantity was not sustainably managed in the State.

#### ii. Bauchi State

The institutional framework in Bauchi state includes Ministry of Water Resources and State Water Agencies; Ministry of Agriculture and Natural Resources, and Ministry of Environment. In addition to state executive governor's directives, the Bauchi State government had reviewed in March 2013 the state water supply and sanitation policy.

iii. Kano State: Kano State has a Ministry of Water Resources and State Water Board; Ministry of Agriculture and Natural Resources, and Ministry of Environment. Water related activities are based on annual budgets, Water Resources and Engineering Construction Agency (WRECA) Kano State Edict 1991, and the Water Supply Edict 2013. In addition to state executive governor's directives, there is lack of State Water Resources Edicts with clearly defined control roles and responsibilities for the various State Water Agencies involved in managing the water of the Lake Chad basin. The effect was that available water quantity was not sustainably managed in the State. The State had Ministry of Water Resources and State water agencies; Ministry of Agriculture and Natural Resources, and Ministry of Environment. These MDAs activities were based on annual budgets;

#### iv. Jigawa State

Water Board and Sanitation Agency law 1999 (Law no. 9, 1999), and water supply and sanitation policy, in addition to state executive governor's directives. There was lack of State Edicts Water with Resource to clearly defined control roles and responsibilities for the various State Water Agencies involved in managing the waters of the Lake Chad basin. Hence, available water quantity in the State was not sustainably managed.

#### v. Katsina State

Katsina State Waste Management Act provides for the effective development and maintenance of sanitation in all areas of the State. The law further provides for proper disposition of excavated silt or earth and other construction materials after any construction project or repair works. Open burning of wastes is prohibited with stipulated penalties.

#### 2.7 Chad Basin Development Authority

The Chad Basin Development Authority (CBDA) was established to promote the development of rural communities in the Chad Basin; to promote the economic empowerment of women; to encourage the participation of rural women in adult education programmes; to engage in vocational training for he women in rural areas; to provide microcredit facilities. The CBDA is mandated to address both agriculture and rural development. CBDA should make "Sustainable Agriculture and Rural Development" of Nigerians as its main goal. In line with this goal, the organization should have its own Vision and Mission that provide proper direction to the activities of the organization and the results it can achieve.

### 2.8 The African Development Bank (AfDB

The AfDB's mission is to fight poverty and improve living conditions on the continent of Africa through promoting investment of public and private capital in projects and programs that are likely to contribute to the economic and social development of the region. The primary functions of AfDB include:

- Making loans and equity investments for the socioeconomic advancement of Member Countries.
- Providing technical assistance for development projects and programs Member Countries.

- Promoting investment of public and private capital for development Member Countries.
- Assist in organizing the development policies of Member Countries.
- Giving special attention to national and multinational projects which are needed to promote regional integration.
- Promote economic development and social progress of its RMCs in Africa;
- Commit approximately \$3 billion annually to African countries.

The infrastructure sector, including power supply, water and sanitation, transport and communications, has traditionally received the largest share of AfDB lending.

## 2.9 Policy Issues and Institutional Gaps in the Komadugu Yobe Basin

### 2.9.2 Policy Issues

The main policy issues of relevance to the implementation of the KY Basin development projects are as follows:

- Conflicts between national and state priorities for investment in and development of water resources as well as between the riparian states themselves. As is often the case in river basins, the upstream users are disproportionally advantaged when compared with downstream users. This in many instances resulted in hot arguments between competing stakeholders.
- 2. Policymaking is still dominated by sectoral planning, with a lack of adequate coordination, and alignment between policies in interrelated sectors and areas such as agriculture, irrigation, food security and the role of private investment, as well as between riparian regions of the same watershed.
- 3. Unintended consequences of national policies promoting national self-sufficiency in food, e.g. imposing restrictions on imported rice and corn as an incentive for farmers to grow crops such as rice and corn, which also happen to be highly water dependent.
- 4. Pricing water for domestic consumption and irrigation is far below its economic value, which leads to over and misuse of water and distorts water allocation decisions.
- 5. The requirement for RBDAs to submit the revenue they collect to the Treasury Single Account (TSA) is a disincentive for RBDAs to improve their services and financial performance.
- Unregulated and uncoordinated private investment in large-scale agricultural projects in the KY Basin without adequate assessment of the water requirements or environmental impact of these projects.
- 7. There are institutional barriers to the sharing of hydrometeorological and water resources information and data between and among organizations and projects. The Nigerian Meteorological Agency (NIMET) is making effort at providing agro climatic and Meteorological information but this is also currently inadequate at providing the needed data for effective water and agricultural planning.

8. Inadequate financial resources for developing and maintaining water resources and related infrastructure. This has necessitated the intervention of International Donor agencies like the World Bank, The African Development Bank etc., financing water projects in the country as in the case of the Challawa Gorge Dam Watershed Management Project.

## 2.9.3 Institutional Gaps

There are a number of institutional issues and gaps that are relevant to the implementation of the KY Basin development projects, as identified by SMEC (2019) as follows:

- There is a wide divergence in the level of development in the upstream part of the KY Basin in particular in Kano, Jigawa and Plateau states, compared with the state of development in the downstream/tail-end parts of the KY Basin in particular in Yobe and Borno states. This imbalance, which is exacerbated by climate change, also applies to the availability of, access to and utilization of water resources in the upstream and downstream parts of the KY Basin as well.
- 2. Riparian state governments, to a large extent, pursue their own development priorities and objectives, in particular in areas such agricultural development, irrigation and infrastructure, and in some cases, invite private investment to participate in development activities to compensate for the lack of public funding and expertise and other reasons.
- 3. Many water resources development activities in the KY Basin are being implemented by projects such as TRIMING and Fadama, which, while supporting many useful initiatives, also attract scarce skilled human resources from government line agencies and risk creating parallel organizations that hinder integration with the responsible public-sector agencies.
- 4. Water resources development activities in the KY Basin are at present not adequately coordinated with emergency and humanitarian assistance being provided by international donors and others to the Lake Chad Basin area and to Yobe and Borno States.

# 2.9.4 Institutional Gaps

There are a number of institutional issues and gaps that are relevant to the implementation of the KY Basin development projects, as identified by SMEC (2019) as follows:

5. There is a wide divergence in the level of development in the upstream part of the KY Basin in particular in Kano, Jigawa and Plateau states, compared with the state of development in the downstream/tail-end parts of the KY Basin in particular in Yobe and Borno states. This imbalance, which is exacerbated by climate change, also applies to the availability of, access to and utilization of water resources in the upstream and downstream parts of the KY Basin as well.

- 6. Riparian state governments, to a large extent, pursue their own development priorities and objectives, in particular in areas such agricultural development, irrigation and infrastructure, and in some cases, invite private investment to participate in development activities to compensate for the lack of public funding and expertise and other reasons.
- 7. Many water resources development activities in the KY Basin are being implemented by projects such as TRIMING and Fadama, which, while supporting many useful initiatives, also attract scarce skilled human resources from government line agencies and risk creating parallel organizations that hinder integration with the responsible public-sector agencies.
- 8. Water resources development activities in the KY Basin are at present not adequately coordinated with emergency and humanitarian assistance being provided by international donors and others to the Lake Chad Basin area and to Yobe and Borno States.

#### **CHAPTER THREE**

#### **PROJECT JUSTIFICATION AND ALTERNATIVES**

#### 3.1 Introduction:

The Challawa Gorge Dam Watershed Management Project is one of the selected priority projects of the Hadeja Jamaare Kom adugu Yobe Basin Trust fund (HJKYB-TF). The purpose of the project is to extend the longevity of the reservoir by reducing the sediment flux into the reservoir through watershed management. The purpose for which the dam was constructed in the early-90s was built to supply drinking water to Kano city and supply irrigation water for the Kano irrigation project. However, recently, watershed degradation has set in resulting in the problems erosion in the watershed area and serious sedimentation problems in the Challawa Reservoir, thereby threatening the life of the reservoir and making water treatment very costly because of high turbidity. In addition, erosion in the upland watershed is affecting farmers' lands and encroaching towards private property and destroying critical infrastructure such as roads, bridges and the dam reservoir embankment. If unattended, the ecological, biological, social and economic benefits derived from the reservoir may be obliterated sooner than the expected lifespan of the dam. The need to implement the watershed management project therefore becomes imperative and necessary.

#### **3.2 Justification for the Project**

There are three main problems associated with Challawa Gorge Dam Watershed that started from watershed erosion and gully formation in the upland watershed, sediment deposition and siltation of the reservoir and sedimentation problems associated with Challawa Water Works treatment plant. These three problems are mainly due to watershed degradation in the upper reaches of the Challawa Gorge Dam Watershed. To fix these problems and extend the longevity of the reservoir to realize its purpose is the main justification for the project. A brief description of each problem is presented below.

#### 3.2.1 The Watershed Management Problem

The watershed Management Project is necessitated by the general degradation of the Challawa Sub-basin watershed. This has resulted in related adverse environmental conditions threatening the life of the Reservoir.

#### 3.2.2 The Challawa Gorge Watershed Degradation problem

Challawa Gorge Watershed Degradation is the main cause of erosion in the watershed, Sedimentation in Challawa Reservoir, and the Kano water works and treatment plants downstream. Natural and human factors are the main causes of erosion in the watershed (Fig. 3.1). Human activities resulting in Land use-Land Cover (LULC) due to agricultural and other human activities instigated by the increasing demand for food and other land resources associated with growing population coupled with poor agricultural practices, are some of the main causes of watershed degradation in the area (Fig. 3.2). Natural factors such as topography, soil type and slope of the watershed combined with rainfall have also significantly contributed towards Challawa watershed degradation by promoting runoff formation with anthropogenic interference as a catalyst to the process. In some places, it is also observed that the need for irrigated agriculture has forced farmers to remove vegetation from river banks for easy supply of water from the rivers and streams. These also result in damage of riparian stream buffers and expose them to severe stream bank erosion.

Plate. 3.1: Catchments Gully formation, Challawa Gorge Dam Watershed Source: SMEC (2019): Hadeja Jamaare Strategic Action Plan, 2019

Plate 3.2: Riverbank Erosion and damage to critical infrastructure in Challawa Gorge Dam Watershed Area (July 2021)

Plate 3.3: Riverbank degradation, farm land erosion and Channel siltation along Gushi River, a tributary to Challawa River (July, 2020)

Plate 3.4: Uncomplimentary Land use practice, Land cover change and Riverbank erosion in the Challawa Watershed area, near Karaye Kano State, Nigeria (July, 2021)

There are three stages in a reservoir's life which are: continuous and rapidly occurring sediment accumulation; partial sediment balance, where fine sediments reach a balance, but coarse sediments continue to accumulate; full sediment balance with sediment inflow and outflow equal for all particle sizes. Evidences from previous studies and discussions with stakeholders, and corroborated by on-sport images reveal that the Challawa Gorge Reservoir is rapidly being filled up with continuous sedimentation leaving the water very turbid for the Challawa water works (Plate.3.6) and endangering the life of the reservoir. This is because of sediment transported from upland watersheds and deposited in the reservoir as point sources and erosion and sedimentation from the reservoir shore line as a non-point source. This therefore requires sustainable sediment control measures.

Plate 3.5: Farmland overtaken by gully erosion upstream of the Challawa Dam (Captured, July 2021)

# 3.2.3 Challawa Water Works Treatment Plant Siltation

The main water supply source for Kano City and the surrounding communities is from Challawa Reservoir. The controlled release from the reservoir flows downstream through Challawa River and reaches at Challawa raw water intake locations. The Challawa water intakes are located along the banks of Challawa River. The water pumped from the river has significant turbidity because of large amount of sediment coming from the reservoir. Previous efforts to remove sediments prior to entering the treatment plant was much beyond the capacity of Kano Water Board, because of the volume of sediment coming from the river (Plate. 3.6).

# 3.3 Potential Benefits and Beneficiaries of the Project

- **3.3.1 Environmental Benefits**: The main objective of the Challawa Watershed Management Project is to extend the longevity of the reservoir by reducing the sediment flux into the reservoir through integrated watershed management. Thus, the project was conceived to manage environmental degradation within the Challawa Gorge Dam basin which manifests as gullies and river bank erosion. The following are the anticipated positive environmental and socioeconomic impacts of the project:
  - y. Reducing erodibility of the soils within the watershed and by extension reduction in siltation and sedimentation of the River Channels and the Reservoir: erosion generally increases sediment load in water and when they are generated from gully and river bank erosion, the amount of sediment load multiplies. However,

with proper implementation of this project, the levels of sediment will reduce substantially by by about 75% which will in turn reduce the amount of silt and sediment in both the rivers and the reservoir.

- z. *Mitigation of Climate Change*: through planting of trees and grasses, this will positively change the land cover from bare to forested land and also provide vegetation to absorb carbon dioxide.
- aa. *Protection against Strong Winds*: if the trees are properly arranged, they will serve as wind breakers which will serve as protection against violent winds that do occur during the rainy season.
- bb. Creation of Underground Water Recharge Zone: the trees and grasses to be planted will reduce surface flow, allowing for more penetration of water through the soil thereby creating underground water recharge zone. This water can be used by the settlements upstream that mostly depend on underground water during the dry season for both irrigation and domestic use.
- cc. *Pollution control:* Has the health benefit of improvement in air and water quality with the potential of reducing incidences of air and water-borne diseases;
- dd. Water storage: flood control, checking sedimentation;
- ee. Minimization of over exploitation of resources;
- ff. *Erosion control* and prevention of soil, degradation and conservation of soil and water;
- gg. *Restoration and enhancement* of environmental aesthetics value of the environment: the natural beauty and attraction of the environment will be restored and enhanced thereby promoting tourism.
- hh. A hedgerow of the vertiver grass will stay where it is planted and sediment that is spread out behind the hedgerow gradually accumulates to form a long lasting terrace with vetiver protection. When used for civil systems and designs the vertiver root is likened to a "Living Soil Nail" with an average tensile strength of 1/6 of mild steel. Thus it benefits the soil by protecting it almost on a sustainable basis, and benefits the farmer by improving farm land management, crop production and overall livelihood.
- ii. Vetiver grass can be used directly as a farm income earning product, or it can be used for applications that will protect river basins and watersheds against environmental damage, particularly point source environmental problems relating to sediment flows and toxic sources.
- jj. Empirical evidences of numerous trials and mass applications of vetiver grass in the last 20 years in many countries also show that the grass is particularly effective in natural disaster reduction (flood, landslide, road batter failure, river bank, irrigation canal and coastal erosion, water retaining structure instability etc.)

environmental protection (reduction of land and water contamination, treatment of solid and liquid waste, soil improvement etc.), and many other uses (Chomchalow, 2005; Nguyen Van Hon et al., 2004; and Le Van Du and Truong 2006).

## 3.3.2 Potential Beneficiaries

All these applications can directly or indirectly impact on the rural poor through either protection or rehabilitation of farm land, providing better moisture retention and provision of direct farm income, or indirectly by protecting rural infrastructure. Overall, it has the potential of enhancing the livelihood of the ordinary rural dwellers through improved food production, food security and income growth.

#### 3.3.3 Bio-diversity Benefits protection and restoration

- i. *Wild life preservation*; protection of endangered species including reptiles, games, soil-enhancing insects, aquatic lives, cultural and exotic vegetation species (trees and grasses) etc.
- ii. *Improved Habitat;* the trees and other vegetation to be planted will improve the regional ecosystem thereby improving habitat for many endangered species like birds, reptiles, large mammals, which will translate into improvement in biodiversity of the plant and animal communities in the area.
- *iii.* The project which may result in increase in the increase in depth of the challawa reservoir has the potential of improving habitat for fish resources in quantity and diversity. Fisheries form an important livewire of the riparian communities around challawa gorge dam. Species richness in sub-lakes is assumed to be positively associated with water depth and aquatic habitat availability (*Nazeef, Jaafar, Abubakar and Kabiru, 2021*).
- **3.3.4 Potential Beneficiaries**: Environmental sustainability, bio-diversity protection, efficient utilization of tax payers' money and improved livelihood for the local communities both upstream and downstream.

#### 3.3.5 Socio-economic Benefits

- h. Allows the Dam to Operate at the Designed Capacity: this is particularly important if the purpose for which the dam was constructed is to be achieved, especially in terms of water storage capacity for irrigation and power generation.
- i. Reduction in the Maintenance Activities on the Rivers and the Dam: managing the degraded sites in the basin may reduce unwanted materials reaching the rivers and reservoir which hitherto has hindered the optimum performance of the

reservoir. This will be economically beneficial to Kano Municipal water supply system not only by reducing management cost, but also improved water quality which also has positive implication for public health in and around the city.

- j. Diversification of Income: if the trees are both exotic and non-exotic, they will provide income to land owners and materials for other uses such as poles for electricity and building. The trees can also be used as collateral for loans.
- k. Sources of Fuel wood for Domestic Use: the project, if well implemented, it the long term will provide fuel wood for domestic use by the people who solely depend on fire wood for cooking and other domestic use.
- I. Reclaiming Lost Farmland: many wasted farmlands will be recovered consequently providing opportunity once again for the owners to begin to earn income from the land and enhance their standard of living.
- m. Social Safeguards: it will reduce the number of impoverished people whose situation has been brought about by reduced land for productive activities.
   Therefore, it will improve the overall prosperity of the areas within the catchment.
- n. To reduce the need for perennial labour emigration: long run reclamation of farm lands lost to land degradation, improvement fish and related aquatic resources in the catchments surface water system have the potential to reduce or permanently discourage perennial temporary labour temporary migration commonly known *Chin-rani* and the cases of "migrant tenant farmers" from the catchment area to other parts of Nigeria in search other means of livelihood among the Hausa people of the area.
- **3.3.6 Beneficiaries:** the Kano state government in particular, the community of farmers, herders, fishermen, including youths, women and other vulnerable groups especially within the riparian communities are potential beneficiaries of the Challawa Gorge Dam watershed management project.

#### 3.4 Project Sustainability

The general sustainability principles (technical, economic, environmental and social) that guided the project's design are set below.

#### 3.4.1 Technical Sustainability

The proposed project is technically feasible because it is professionally designed, and the technology employed is readily available and not too complex. The timing of the project when most residents of the Challawa Dam Environment and the Kano State government are expressing concern about the continuous sedimentation of the dam with ripple effect on the water treatment plant at Panshekara supplying water to Kano Municipality and its environs. The Hadeja Jamaare River basin Authority's pool of technical and administrative experts, and the pool of technical expert in the industrial region of Kano are encouragement for sustainability of the project. Moreover, the predominantly agricultural community of the project area constitutes a pool of employable labour to support the bio-remediation and agricultural measures components of the project because they stand to be immediate benefiaries of the project. With government political will and support the project is highly sustainable.

## 3.4.2 Economic Sustainability

The project is targeted to cover 985 Ha (around Reservoir, Pilot '1' and Pilot '2') and a further 500 ha of farmlands. There will be no immediate direct benefits for the 500 of farm lands, it is expected that the 985 ha will be placed under grass, trees, fruit trees and intercrops as shown in Table 3.5 below.

| Vegetation Type  | Buffer<br>strips | Pilot Area 1 | Pilot Area 2 | Around<br>Reservoir | Total (Ha) |
|------------------|------------------|--------------|--------------|---------------------|------------|
| Grass            | 12               | 166          | 131          | 160.00              | 469        |
| Avocadoes        | 0                | 74           | 50           | 150.00              | 274        |
| Oranges          | 0                | 26           | 17           | 65.00               | 108        |
| Onions/tomatoes* | 0                | 0            | 0            | 215.00              | 215        |
| Trees/shrubs     | 4                | 10           | 20           | 100.00              | 134        |
|                  | Buffer<br>strips | Pilot Area 1 | Pilot Area 2 | Around<br>Reservoir | Total (Ha) |
| Total (Ha)       | 16               | 276          | 218          | 690                 | 1,200      |

Table 3.1: Targeted Acreage for Grass, Trees, Fruit trees and Intercrops<sup>#</sup>

\* the onions and tomatoes will be intercropped with fruit trees (avocadoes and oranges) in the area around the reservoir for the first 3 years. Farmers are currently cropping in some of the targeted areas and it is assumed they will continue cropping high value vegetables (such as onions and tomatoes) until the project start realizing some harvests from the fruit trees.

<sup>#</sup> curled from SMEC Report 2019, pp.97-99

#### Cost of Production and Revenue from Grass, Trees & agricultural crops

Table 3.2 highlights a summary of expected yields and incomes for the project. Only grass and onions/tomatoes is expected to bring income in the first 3 years while fruit trees (avocadoes and oranges) will start bringing income from third year. Project income is expected to stabilize from 7<sup>th</sup> Year.

| Table 3.2: Yield, Production Cost and Expected Revenues | # |
|---|---|
|---|---|

| Type of<br>Vegetation | На  | Expected<br>Yield year 3<br>(Kgs/Ha) | Expected Yield<br>from year 7<br>onwards (Kgs/Ha) | Price (N/Kg) | Productio<br>n Cost<br>(N/Ha) | 3 <sup>rd</sup> Year<br>Revenue<br>(N/Ha) | Year Onwards<br>Revenue<br>(N/Ha) |
|-----------------------|-----|--------------------------------------|---|--------------|-------------------------------|---|-----------------------------------|
| Grass<br>(Kgs of hay) | 469 | 8,000                                | 8,000   | 20           | 60,000                        | 160,000                                   | 160,000                           |
| Avocadoes             | 274 | 7,000                                | 18,000  | 250          | 320,000                       | 1,750,000                                 | 4,500,000                         |
| Oranges               | 108 | 5,000                                | 14,000  | 100          | 237,300                       | 500,000                                   | 1,400,000                         |
| Onions/<br>tomatoes   | 215 | 16,000                               | -   | 120          | 453,250                       | 1,920,000                                 | -                                 |
| Trees (No)            | 134 | 0                                    | 40  | 6,000        | -                             | -   | 240,000                           |
| Total                 | 985 |                                      |   |              |                               |   |                                   |

<sup>#</sup>curled from SMEC Report 2019, pp.97-99

Expectedly therefore, as in table 3.6:

- Yield of hay (grass) is expected to be about 8,000 Kgs/ha by third year with total cost of production being about N 60,000 per ha and total revenue N 160,000 per Ha.
- Yield of onions or tomatoes is expected to be about 16,000 Kgs/ha by third year with total cost of production being about N 453,250 per ha and total revenue N 1,920,000 per Ha. It is assumed the vegetables will be grown as intercrops until 3<sup>rd</sup> year after which fruit trees are expected to cover the ground.
- Yield of avocado will in 3<sup>rd</sup> year (at about 7,000 kgs/Ha) and reach 18,000 Kgs/Ha by 7<sup>th</sup> Year. The expected production cost and revenue from 7<sup>th</sup> year is N 320,000/Ha and N 4,500,000/ Ha respectively.
- For trees, about 40 trees (10%) are expected to be harvested from 5<sup>th</sup> year onwards bringing a net income of N 240,000 per year

Table 3.3 provides a summary of total costs, total revenues for the whole Project.

| Grass     | Area | Yield  | Production | Total project | Revenue   | Total Projected | Gross margin | Total project net revenue |
|-----------|------|--------|------------|---------------|-----------|-----------------|--------------|---------------------------|
|           | (Ha) | kg/ha  | cost       | Costs N       | (per Ha)  | revenue         | (Per Ha)     | Ν                         |
|           |      | Kg/ha  | N/ha       |               | N/ha      | Ν               | N/ha         |                           |
|           | 469  | 8,000  | 60,000     | 28,140,000    | 160,000   | 75,040,000      | 100,000      | 46,900,000                |
|           |      |        |            |               |           |                 | Gross        | Total                     |
| Avocadoes | 274  | 18,000 | 320,000    | 87,680,000    | 4,500,000 | 1,233,000,000   | 4,180,000    | 1,145,320,000             |
| Oranges   | 108  | 14,000 | 237,300    | 25,628,400    | 1,400,000 | 151,200,000     | 1,162,700    | 125,571,600               |
| Trees*    | 134  | 40     | 24,000     | 3,216,000     | 240,000   | 32,160,000      | 216,000      | 28,944,000                |
| Total     | 985  |        |            | 144,664,400   |           | 1,491,400,000   |              | 1,346,735,600             |

.

Table 3.3: Expected Project revenues and Costs<sup>#</sup>

\*assumes a population of 400 trees per acre with only an equivalent 10 % of this (40 trees) being used as firewood every year after 5 years. <sup>#</sup> curled from SMEC Report 2019, pp.97-99 As shown in Table 3.8, it is projected that the 985Ha placed under grass, avocadoes, oranges, onions/tomatoes (intercrop) and trees/shrubs will have a total annual net revenue of about N1,346,735,600 (as at 2019) from 7<sup>th</sup> year onwards, hence the economic sustainability of the project is supported.

#### 3.4.3 Social Sustainability

Social sustainability is contingent on social acceptability which, for the Challawa Gorge Dam, is not in doubt, judging from the ecstasy with which the communities welcomed the idea of watershed treatment for future survival of the infrastructure. Residents of Karaye and other communities in the neighborhood of the Challawa Gorge Dam in Kiru, Rogo and Turawa welcome the project which in their opinion has reduced the phenomena of temporary youth migration out of the communities for dry season job-seeking otherwise known in Hausa as *chinrani* because of the irrigation and fishing opportunities provided by the Dam. Also, the benefit to create job opportunities for unemployed indigenes especially the youths and diffusion of erosion management techniques hitherto unknown to the community of farmers would ensure social sustainability. The HJKYB-TF on the other hand nas demonstrated commitment to effective and sustained stakeholders' engagements and consultations towards the success of the watershed rehabilitation project. The proponent is also committed to complying with applicable national social laws, relevant international conventions, and AfDB safeguards requirements and training and retraining the PIU team members on environmental and social management risks.

#### 3.4.4 Environmental Sustainability

The project is a rehabilitation activity to improve the functionality, sustainability and operational efficiency of the Challawa Gorge Dam which has been in existence since 1992. The watershed management is to enhance the ecosystem, improve biodiversity, protect the soil from further degradation, reduce or mitigate channel and reservoir sedimentation through bio-engineering techniques that are environmentally friendly, socially acceptable and economically viable. Moreover, social and environmental mitigation measures have been suggested for the identified environmental and social impacts of the watershed management project.

The proponent (HJKYB-TF) is aware of, and committed to, complying with all relevant country environmental laws, applicable international conventions and AfDB environmental and social safeguard requirements to implementing the ESMP developed to guarantee environmental sustainability. The proponent also has a department that handles environmental issues related to its activities in the discharge of it mandates. The HSE

department is headed by a Director who reports directly to the Bank's senior vice president. A significant number of ESIAs and environmental audits have been conducted in the past by the proponent; hence, they have the technical skills needed to manage the mitigations determined for the identified impacts of this project.

#### 3.5 Analysis of Project Alternatives

Watershed management technique is not a one-cap fit all-heads strategy. Several alternatives are possible. However, the choice of any approach depends much on the watershed scale (size), nature of the watershed problem, objectives of the watershed management intervention and the administrative and legal system of the management process. The cost of Watershed Management system is also a determinant of alternative choices in watershed management strategy to be adopted. Engineering and Bio-remediation options designed for the Challawa gorge dam watershed may be expensive in terms of construction, management and sustainability even though its advantages are also enormous. Alternative watershed management approaches that may be possible to address the degradation of the Challawa Gorge Dam are presented in table 3.2 and discussed in subsequent sections.

|    | Project       | Description               | Expected Benefits and beneficiaries           |                            | Expected Beneficiaries                |  |  |
|----|---------------|---------------------------|---|----------------------------|---------------------------------------|--|--|
|    | alternative   | rnative Positive Negative |   |                            |                                       |  |  |

## 3.5.3 Participatory Watershed Management option:

Participatory watershed management is an option. In order to make the watershed development/management work successful the people of the riparian communities' participation is very important. The Participatory Watershed Management (PWM) approach has been proved to be beneficial in different forms and in different places e.g. India and Thailand. The main objectives of participatory approach to watershed management include:

- a. To involve the local communities in management of the watershed and contribute directly in their livelihood strategies.
- b. To witness the collaboration amongst a diverse group of stakeholders, and also to evaluate/examine various challenges faced by the communities;
- c. To develop learning awareness amongst rural communities on various aspects such as traditional forest management, natural resource management and community networks;
- d. To develop learning awareness about integrated approaches to watershed management.
- e. To create awareness on how the participatory policies can affect the watershed management.
- f. To promote interaction amongst local communities and thereby enhance a sense of community and ownership of their common resources for sustainability.
- g. To review the challenges of participatory watershed management practices.

#### 3.5.3.1 The main benefits of the participatory alternative

- a. The management of natural resources becomes possible by the associated landowners/communities residing in the watershed.
- b. It helps in the alleviation of poverty among the rural mass.
- c. The overall improvement in the livelihood of rural families is made possible by this approach.
- d. It helps to develop a kind of coordination amongst people of diverse communities and create a sense of unity among them;.
- e. The speed of work progress gets increase.
- f. It develops a kind of friendship amongst the rural mass of the watershed; and by virtue of which the rural mass can do any kind of development work in the watershed, themselves.

In brief, the participatory watershed management practice enables the communities to remove the problems and achieve better control over natural resources and livelihoods of watershed.

#### 3.5.3.2 Disadvantage

- i. The approach is usually most successful at a micro scale level. The micro-watershed level approach does not necessarily aggregate up or capture upstream-downstream interactions. Thus, not suitable for the Challawa Gorge Dam case:
- ii. Profitability is key to engaging stakeholders in conservation, and participatory watershed management intervention approach may not in itself be profitable for stakeholders;
- iii. Establishing accurate estimates of costs and benefits, both at the farm level and beyond, is always difficult. There is the risk that technical choices may be made without due consideration for financial profitability, or of economic value to society.
- iv. Although poverty reduction is usually an objective of watershed management programs, empirical evidence of poverty reduction impacts is weak. Its economic impact may be weak too;
- v. The poor may even be at risk from the approach; landless people dependent on common natural resources for their livelihood may suffer from conservation interventions, such as rangeland closure;
- vi. Participation does not, however, guarantee specific outcomes; it involves shifts in decision making power between the state and local communities, and also between different segments of the local community;
- vii. Participatory approaches imposes a demanding set of requirements: political commitment and equitable rules, time for the process to mature, careful sequencing, inclusion of all stakeholders in the process, public agencies that understand the rationale and process of participation, and sustained capacity building at all levels for both stakeholders and public agencies (which may be difficult to realize).
- **3.5.4 Rainwater Harvesting:** Rainwater harvesting means collection and storage of rainwater by some mechanism, to make water available for future use. An appreciable amount of precipitation, which is generally lost as surface flow, can be harvested and stored for useful purposes like drinking and providing supplemental irrigation to the crops. While this will reduce surface run-off and soil loss, it is impracticable for a macro-watershed such as Challawa. The benefits and shortcomings of this alternative are presented in table 4.2.

## 3.5.4.1 Adaptive Watershed Management option:

The adaptive watershed management follows the principle of landscape ecology in its work on watershed-wide resource management and planning. This approach simultaneously emphasizes understanding the ecological, social and economic consequences of changes in urban and rural land use in the context to watershed.

Different elements of watershed can be integrated into adaptive management strategies to achieve more sound land-use and sustainability in economic and natural resources.

To protect and restore the valuable watershed natural resources, adoptive watershed management may involve the following measures:

- a. Classification of critical watersheds for fixing priorities regarding their conservation based development of land-use diversity and management strategies;
- Identification of critical threats such as surface and groundwater pollution, soil erosion, poor eco-system etc. to protect the valuable resources and establishments of watershed.
- c. Development of recommendations in the light of watershed management to ensure sustainable and good quality water availability and to maintain the productive aquatic resources.
- d. Identification of system-wise controlling processes and mechanisms to distinguish environmental indicators for evaluating eco-system health.
- e. Formulation of recommendations on land-use impact mitigation, habitat restoration programs, and other remediation techniques in watershed disputes.
- f. Evaluation of socioeconomic values of watersheds and their environmental services for policy development and management planning.

#### 3.5.5 Reservoir dredging option

This option is a one-time temporary solution that has more disadvantages than advantages. It is not sustainable because it has to be a recurrent phenomenon that may be expensive. In addition the option fails to treat the sources of the sedimentation which is an annual problem.

#### 3.6 Public views and concerns of the Alternatives:

After explaining the implications of the participatory approach to a cross section of the local communities during interaction and consultations, they felt exited especially for the fact that their participation introduces a new innovation in erosion management. The idea of that farmers and local communities could participate in vertiver grass production, planting and maintenance was welcomed.

On the other hand adaptive watershed does not appear to be appealing to the public around the project area. The general feeling was that this approach is cumbersome and probably only implementable by government because of its complexity and cost implications. The idea of drainage the reservoir appeared highly acceptable to the local communities especially fishermen who believe that the deeper the reservoir, the better the population and variety of fish species, and b implication the better their income from fishing activities.

# CHAPTER FOUR PROJECT DESCRIPTION

#### 4.1 Background to the Watershed Management Project

The Komadugu Yobe Basin (KYB) covers an area of 84,000km<sup>2</sup>. It is of strategic national and international importance as it supports the livelihood of over 15 million people in six Nigerian States including Bauchi, Borno, Jigawa, Kano, Plateau and Yobe who are directly or indirectly dependent on the scares water resources. The KYB which is located in the semi-arid north-eastern Nigeria represents approximately 35% of the Lake Chad Basin and is important as a trans-boundary water resource. The Federal Government of Nigeria, in collaboration with SMEC and the African Water Facility, has prepared the Komadugu Yobe Basin Strategic Action Plan (SAP 2019) as a long-term development strategy promoting the management and use of the basin water resources for inclusive and sustainable growth and development. The Strategic action plan (SAP 2019) for the water resources development in the Komadugu Yobe (KY) basin, obtained from the HJKY-TF, identified four priority Sub-Programs/Schemes, among which is the Challawa Gorge Dam Watershed Management Sub-Program.

The Government of Nigeria through funding from the AfDB is financing additional studies for the priority investment projects. The studies include Environmental and Social Impact Assessment for the proposed Challawa Gorge Dam Watershed Management Sub-Program. In this regard the HJKY-TF (which is the Implementing Agency) seeks for consultancy services to prepare the ESIA and ESMP of the Watershed Management to assess the potential (positive and negative) environmental impacts of the proposed infrastructures construction and related activities and propose a management Environmental and Social Management Plan to address the predicted impacts for the Challawa Gorge Dam Watershed Management Sub-Project.

The SAP (2019) report identified three sets of leading problems associated with the Challawa Gorge Dam Watershed component of the HJKYB development. The previous study revealed that the problems started from watershed erosion and gully formation in the uplands watershed, sediment deposition and siltation of the rivers and the reservoir (Plates 4.1 and 4.2), and sedimentation problems downstream associated with Challawa Water Works treatment plant, all arising mainly from watershed degradation in the upper reaches of the Challawa Gorge Dam Watershed Area. Thus, the project was conceived to remediate environmental degradation within the Challawa Gorge Dam area which manifests as gullies and river bank erosion, and eventually river beds and Challawa reservoir sedimentation and destruction to critical infrastructure (Plate 4.3) while also affecting biodiversity through ecosystem destabilization.

Plate 4.1 Siltation along Challawa River Channel

Plate 4.2 Challawa Gorge Dam Reservoir Sedimentation Problem

Plate 4.3: Challawa River Bank degradation and destruction of critical infrastructure

## 4.2 Project Location

The Project is located in Kano State Northern Nigeria, close to Karaye town about 120 km south west of Kano City, within the HJKY Basin (Fig. 4.1 and 4.2). The main Challawa Gorge Dam watershed boundary falls into three States' administrative boundaries namely Kano, Katsina and Kaduna. The project area is located in the HJKY River Basin with geographic coordinates of 11°41'21.29"N and 8° 0'49.16"E, at the Challawa Gorge Dam (figure 4.3). The watershed area covers about 3,842 km<sup>2</sup> with an altitude ranging between 520 to 720masl. It is a major reservoir on the Challawa River, a tributary of Kano River. The Challawa Dam itself lies astride the land areas of three riparian local government areas of Karaye, Rogo and Kiru in Kano State. Although the upper reaches of the Challawa Sub-basin watershed extends to parts of Katsina and Kaduna States, the greatest areas of the project likely to be more affected lie in Kano state, especially areas in Karaye, Kiru and Rogo Local Government Areas. The Challawa River itself forms a tributary to the Kano River which drains into Tiga Dam in Kano State and further downstream of the Hadeja Jamaare river system in Jigawa and Bauchi States.

Fig. 4.1: Map of Nigeria Highlighting Kano State

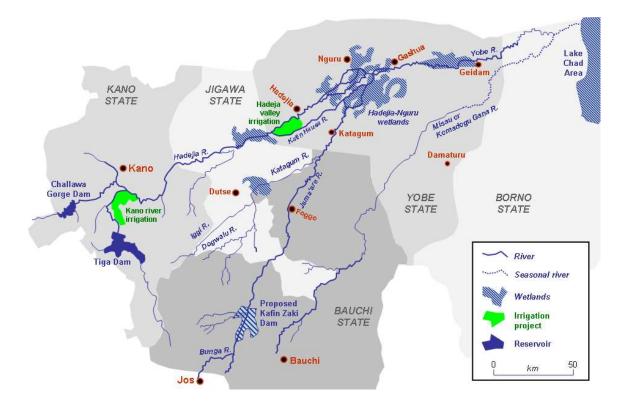

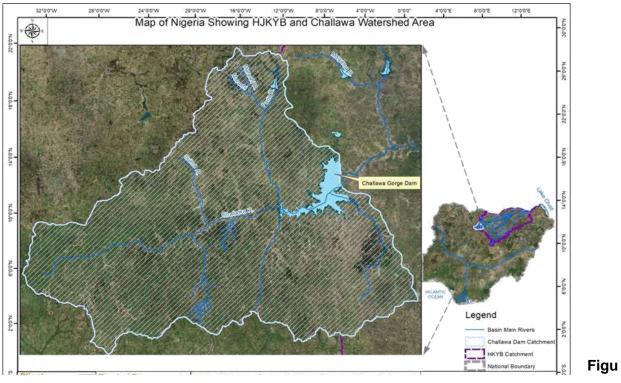

Figure 4.2: Challawa Gorge Dam within the Hadeja Jamare Komadugu Yobe Basin

re 4.3: Challawa Gorge Dam Watershed Management Project Location Source: SMEC (2019) HJKYB SAP, 2019

The project was initiated in 1975 by the Kano State Water Resources and Engineering Agency (WRECA) which was responsible for both design and construction. HJRBDA, who took over responsibility in 1977, commissioned Haskoning Company to supervise the construction of the dam in 1980 which they did until their contract expired in 1983. Construction continued at a slow pace until 1989 when Julius Berger Nigeria PLC was appointed as the contractor while Water and Dam Services Company was appointed to supervise the construction. The dam was completed in 1992 using rock fill construction. It is about 42m high and 7.8km long (Plate 4.4). The dam has a full storage capacity of 904,000,000m<sup>3</sup>.

The main land use types in the project area are typically agricultural including crops and animal husbandry and other remotely related non-agricultural livelihood activities such trading, firewood marketing, etc. With a cumulative land area of about 2,216.2km<sup>2</sup> and cumulative 2021 population size of about 1,050,289 (projected from 2006 figures at the states average growth rate of 3.4%) the three Local Government Areas most affected by the project have a combined estimated population density of about 474/sq.km. (2021).

#### 4.3 Objectives of the Challawa Gorge Dam Watershed Management Project

The Challawa Gorge Dam Watershed Management Project is one of the four priority projects selected for development by the HJKY-TF. The overall objective of the project is to extend the longevity of the Challawa Gorge Dam reservoir by reducing the sediment flux into the reservoir through watershed management, involving design of erosion control structures, provision of bioremediation and other agricultural measures; and construction of gabion check dams and sediment traps, etc. The SAP (2019) of the Challawa Gorge Dam rehabilitation project noted that the project is expected to significantly reduce the siltation problem in the Challawa reservoir and contribute significantly to soil conservation within the watershed, and also address the problem of sedimentation at the Challawa Water Works treatment plant with all the associated positive effects.

Plate 4.4. A view of the Challawa Gorge Dam Reservoir

## 4.4 The Project Components and Activities

## 4.4.1 General Site Description of the project

The Challawa Watershed management project is aimed at erosion and gully control and reducing sediment deposition in the reservoir through watershed management intervention. The proposed watershed management work largely includes provision of erosion control structures in the upland active watersheds producing large amounts of sediments. For this purpose, two pilot sub watersheds were selected and appropriate erosion control measures were designed and presented for the two sites.

The selected Pilot sub watersheds have been designated as **PSW\_1** and **PSW\_2**, each containing its own main and finger gullies and draining into the main rivers that later join the Challawa River (fig. 4.4). The gullies identified in the two sub watersheds (PSW\_1 and PWS\_2 and the works to be carried out on each are presented in table 4.1. The gullies have very steep slopes from the head to middle reach and tend to have milder slope near the outlet, forming a relatively stable and wide bed. The gullies are expanding upstream by head cutting and laterally with stream bank erosion. Urgent intervention is needed to stop the gully from developing laterally and endangering the surrounding farm land and deposition of sediments in the downstream reservoir. The gully is shallow at its tail and is deeper in the middle and head section, up to 30m depth. The width of the gully varies from

60m at shallower areas to 30m at the deeper sections. The shape of the gully is generally V-shape gully at the head and middle with a side slope ranging from 30° to 40°. In Pilot Sub Watershed 1 gully site, the level of gully erosion is so active that it is progressing aggressively towards the adjacent farm lands encroaching into private properties.

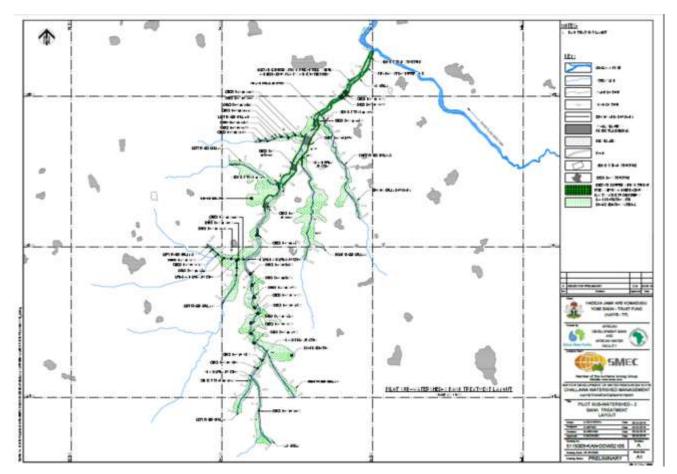

Figure 4.9: General Layout of Pilot Sub-Watershed\_2 (PWS\_2) Source: SMEC (2019) SAP Report

Index: Mg = Main Gulley; LFG = Left Finger Gulley; RFG = Right Finger Gulley.

Considering the nature and extent of erosion and other site-specific conditions within the sub-watersheds, check dams and sediment traps were proposed as the most feasible erosion and sediment control structures within each pilot sub watersheds. This is to be further integrated with bio engineering measures, as well as agricultural measures. The control measures are to be provided inside the main and finger gullies and on adjacent farm lands and on the eroded river banks. To do this, the gulley sections were designed to be provided with check dams to stabilize the flow and promote sediment deposition. The check dams are to serve as a grade control and energy dissipation structures along the main and finger gullies. The check dams are designed to be provided at recommended intervals to serve as grade and velocity control.

Overall, Challawa Gorge dam watershed covers an area of 3,842 km<sup>2</sup> but the measures proposed in this study covers two pilot sub-watersheds with an area of 3,150 ha (pilot 1) and 2,661 ha (Pilot 2). Proposed measures for control of sediment flux include:

- (i) Construction of soil erosion control structures for:
  - Main gullies
  - Finger gullies
  - Check dams
  - Sediment traps
- (ii) Gully bank treatment:
  - Bio-remediation through planting of vetiver grass
  - Agricultural erosion control methods
- (iii) Buffer zones which include:
  - Riparian buffer for Challawa reservoir
  - Buffer zones for pilot water shed streams

The proposed measures will be undertaken in a total area of 1485 Ha as outlined below:

- Around reservoir (475 Ha)
- In Pilot area\_1 (276 Ha)
- In Pilot area\_2 (218 Ha)
- In Buffer strips in Pilot area '1' and '2' (16 Ha), and
- On Farmlands (500 Ha)

## 4.4.2 Project Component 1: Gully Bank Erosion Control

The watershed level of the Challaawa Gorge Dam down-cutting is causing the stream bank to become too steep for vegetation to exist, this is encroaching towards farm lands and there is little a farmer can do to protect a streamside other than temporary fixes. In addition, the erosion is also due to human activity along the riparian area, like cutting down vegetation for agriculture land and allowing livestock access along long portions of a stream (Plate 4.6). On Plate 4.6, farmers are cultivating their lands to the edge of river (A), and cattle grazing along the stream corridor (B) are common sites in the project area. The banks of the rivers are not protected with vegetation and farmers cultivate the land to edge of the river promoting lateral erosion. The components of erosion control structures proposed for the project were based on the severity of the erosion and other technical considerations (SMEC, 2019, p.38). The proposed erosion control measures include Check dams, bioengineering and agricultural measures.

Plate 4.5: Farmers cultivating land to the edge of river

Plate 4.6: Cattle grazing along the stream corridor

#### 4.4.3 Check Dams component

Check dams made of gabions are one of the most practical and effective erosion control measures used for stabilisation of gullies and erosion sites. They are proposed to be provided to stabilize active gullies and steep slopes in Challawa Gorge Dam Pilot Sub-Watershed areas. Check dams are provided to stabilize the gradient of the gully beds in the steep slope reaches of **PSW\_1** and **PSW\_2** gullies. The check dams are proposed to promote sediment deposition and later create stable bed gradient for the gullies. A total of 50 check dams were proposed for the two pilot sub-watersheds. There are 15 proposed gabion check dams for PWS\_1 and 35 for PWS\_2. The approximate locations of the check dams are presented in table 4.4 below.

## 4.4.4 Stream bank stabilization with Bio-remediation

## A. Grading and trimming

The middle reach of the gully has relatively narrow and very deep exposed gully bank section with slope varying from 45 to 50 degrees. This slope is not stable for such poorly structured geological formation. Therefore, the slope of gully banks is proposed to be graded with the following recommendations:

- Provision of graded slope of 1:1.5 with 4m wide berm at the middle of the bank, the proposed graded bench is horizontal and along the contour and interceptor drainage is provided every 10m elevation interval in order to intercept the storm water and evacuate to the collector drain.
- Provision of bio-degradable geo matt on the treated surface where the gully slopes are steep and exposed the geo-matt will create a support of the banks until the bio-remediation is fully developed.

Even with bank stabilizing measures, the gully banks are still vulnerable to further erosion by uncontrolled surface stormwater runoff from the surrounding areas. Hence, protection measures are provided. After careful analysis of various types of bank protection measures, vetiver grass was selected and explanation provided in the following sub section.

# Plate 4.7: Exposed Gully bank at PWS-2 Main Gully erosion site Source: SMEC, SPA (2019) Challawa Gorge Dam

Engineering construction of erosion control structures inside the stream channels, and providing bio-agricultural measures including forest buffers along river banks and gully prone locations within the watershed (Table 3.1).

#### B. Bio-remediation (Vetiver grass)

The non-vegetated slopes are subject to frequent and sometimes serious erosion process, due to storm water runoff. The gully banks are exposed in active reaches of the gully and are vulnerable to surface erosion from direct rainfall. These exposed surfaces shall be covered with vetiver or other fast growing deep rooted grass in order to minimise the formation of rill type of waterways. Bio-remediation measures can be used to protect gully bank walls and prevent erosion. They provide important resistance to erosion forces and more aesthetic and environmentally friendly than other structures. Accordingly, the main bio-remedial measure proposed at Challawa Gorge Dam Pilot Sub watershed site is planting of vetiver grass on gully bank slopes of less than 40<sup>0</sup>.

#### C. Measures for growing Vetiver grass

#### i. Description

The proposed work for gully slope stabilization consists of planting fast growing Vetiver grass.

#### ii. Vetiver grass

Vetiver is a perennial and fast-growing grass growing up to 2 Metres high with roots stretching down to 3 Metres deep in the ground. It has a strong dense and vertical root system and grows in extreme climate and environmental conditions. The vetiver grass can grow on deep sandy soil, under humid conditions and can survive in more than 700 mm rainfall. The whole plant is a Culm, from leaf to roots. Vetiver displays a high level of tolerance to soil acidity, salinity and acid sulphate conditions. Vetiver grass grows quickly and becomes established under hostile conditions. The very deep and extensive root system provides structural strength in a relatively short period of time. The main disadvantage of Vetiver is its intolerance to shaded areas, particularly during its establishment phase. It is also difficult to plant on very steep slopes.

## iii. Special characteristics of Vetiver grass:

Some special characteristics of vetiver grass include:

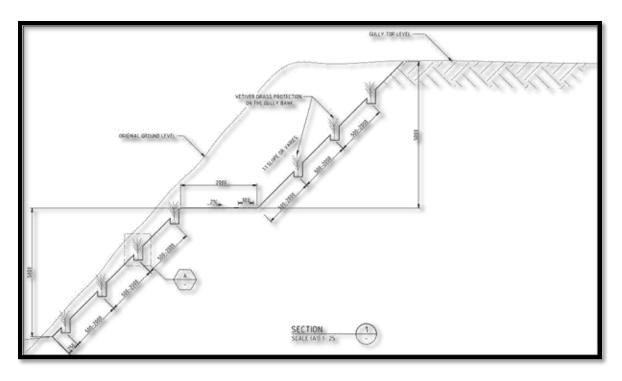

- Given its extraordinary root depth and strength, mature Vetiver is extremely resistant to washout from high velocity flow.
- The mean tensile strength of Vetiver is about 75 Mpa at 0.7mm-0.8 mm root diameter which is common size and so its roots have been proven positive for slope reinforcement which means the increase in shear strength of soil increase in shear strength of soil.
- On steep slopes (30-60 degrees), the Vetiver spacing between rows at 1m vertical interval is very close and therefore the grass moisture uptake would be greater to offset the increase in

infiltration and further improve the slope stabilization process. However, to enhance the use of Vetiver on steep slopes in very high rainfall areas, a precautionary measure is to plant Vetiver hedges on a gradient of about 0.5% as in graded contour terraces to divert the extra water to stable drainage outlets.

## iv. Gully Slope Stabilization

The vetiver vegetation is being used as a natural and effective bio-engineering tool to control erosion and stabilize slopes against sheet flow erosion:

- Vetiver roots can penetrate a compacted soil profile providing a good anchor for fill and top soil.
- Vetiver's extensive and thick root system binds the soil which makes lodgeit difficult.
- When planted closely together Vetiver plants forms dense hedges that reduce flow velocity, spread and divert runoff water and create a very effective filter that control erosion.
- Acting as a very effective filter, Vetiver hedges reduce the turbidity of surface runoff. Since new
  roots develop from nodes when buried by trapped sediment, Vetiver continues to rise with new
  ground level and terraces form at the face of the hedges. The fertile sediment typically
  contains seeds of local plants which facilitate their re-establishment.

| S/No.  | Project Component   | Component Description   |  |  |  |  |

| 8  | Erosion Control<br>measures on Farm:<br>Contouring | <ul> <li>This is the practice of orienting field operations such as ploughing and planting along the contour.</li> <li>Contours are level lines across a slope at a constant elevation.</li> <li>It reduces surface runoff by trapping water in small depressions and decreases the incidence of rill formation.</li> <li>Contouring is proposed in steep cultivated lands of Pilot sub watersheds with slope exceeding 5%.</li> <li>Vegetative barriers (such as grassy strips) will be located on the contour to control soil erosion.</li> <li>Water flowing down the slope picks up soil. When it reaches a contour barrier it slows down, the soil particles settle out, and more water enters into the soil.</li> </ul> |
| 9  | Strip Cropping                                     | <ul> <li>For water erosion control the strips may be aligned along the contour and the crops follow a different rotational sequence so that the entire field is never bare.</li> <li>Buffer strips may also be used to protect sensitive areas of the field from erosion, or to create areas which will retard runoff and trap sediment.</li> </ul>   |
| 10 | Conservation Tillage                               | <ul> <li>One of the most important agricultural conservation measures being adopted in many areas of the world in recent years is the reduction in tillage (turning of the soil).</li> <li>Under conservation tillage, the crop stubble is left standing and residue is evenly spread across the field as mulch instead of being ploughed under.</li> <li>Weeds are controlled by cutting and herbicide.</li> <li>Compared to conventional tillage, conservation tillage can increase soil organic matter, reduce erosion by as much as 90%, enhance infiltration, and reduce moisture loss.</li> <li>When implemented across a watershed, the enhanced</li> </ul>  |

|          |                   | infiltration can reduce peak discharge and downstream fleed   |
|----------|-------------------|---|
|          |                   | infiltration can reduce peak discharge and downstream flood damages.  |
| 11       | Grassed Waterways | <ul> <li>This is a shallow drainage way in which vegetation protects the channel against erosion, thereby increasing the permissible (non-erosive) velocity compared to bare soil;</li> <li>Maximum permissible velocities depend on the type of grass, but are generally limited to about 1.2 m/s and slopes not exceeding 5%.</li> <li>For streams that have a base flow, a stone centre is provided. Scour resistance may be enhanced by geo-synthetic reinforcement;</li> </ul>   |
| 12       | Terraces          | <ul> <li>Terraces work against gravity, interrupting the tendency of water to flow down- slope.</li> <li>It is recommended to use stiff grass hedges in Challawa Watershed area by planting a dense hedge of stiff grass on the contour, which retards runoff and causes water to pond and deposit sediment on the uphill side of the hedge.</li> <li>Because it is living, the grass hedge will become stronger with time and can grow as sediment collects and the terrace height increases.</li> <li>Deposited sediment fills in low spots, runoff tends to become more evenly dispersed and less erosive with time, and the hedge tends to naturally build terraces that follow the contour.</li> </ul> |
| Buffer z | ones construction |   |
| 13       | Riparian buffers  | In the Challawa Gorge Dam watershed, provision of riparian buffer<br>around the reservoir and maintenance of existing riparian buffers<br>in their natural condition has been identified as one of the most<br>effective means of protecting Challawa Gorge Dam reservoir<br>sedimentation, including water quality, hydrology, natural<br>communities, and watershed ecosystem function.   |
|          |                   | <ul> <li>Objective of the buffer strips</li> <li>Reduce erosion runoff of sediment, nutrients and other potential pollutants</li> <li>Remove pollutants from water runoff</li> <li>The objectives of proposed buffer strip are mainly to:</li> <li>Intercept sediments and remove nutrients and other non-point</li> </ul>  |

| 14 | Stream Buffer Strip           | <ul> <li>source pollutants from surface runoff and also serve to prevent erosion of soil through soil stabilization.</li> <li>Attenuate runoff. Maintenance of riparian vegetation or stream buffer strips and reduction of erosion lowers the potential for substance movement by surface runoff, thereby reducing the potential for water quality degradation.</li> <li>Enhance the landscape diversity, providing visual appeal and also serve to conserve and/or supplement open space.</li> <li>Reservoir buffers are recommended in different widths around the reservoir as per the required purpose. In order to design and maintain an effective buffer it is important to assess the physical condition of the reservoir corridor. However, for this preliminary design a reservoir buffer width of 30m is recommended, as per literature, is proposed.</li> </ul>  |
|----|-------------------------------|---|
| 14 | Stream Buffer Strip<br>design | <ul> <li>The spatial placement of buffer strips within a watershed can have profound effects on water quality.</li> <li>Riparian buffers in headwater streams (i.e., those adjacent to first-, second-, and third-order systems) have much greater influences on overall water quality within a watershed than those buffers occurring in downstream reaches;</li> <li>Downstream buffers have proportionally less impact on polluted water already in the. On the other hand, buffer strips on the downstream rich of the river will have significant impact for stream bank erosion.</li> <li>Location within Watersheds</li> <li>The location of the buffer strip depends on its objective and purpose. The main purpose of stream buffer strips in this Project is for stream banks stabilisation. This will focus on the reach of the stream where bank erosion is active;</li> <li>Therefore, buffer strips are provided at downstream reaches of gullies.</li> </ul> |

4.4.5 Erosion control structures: The Engineering Construction Component of the Project Structural (engineering) measures to control gully formation and check channel and reservoir siltation are to be constructed inside the gullies while bio-remediation and agricultural measures are to be provided on eroded gully banks and adjacent farm lands respectively to stabilize soil, and reduce surface flow. Gabion check dams and sediment traps are the main structural measures to be provided at selected sites. Selection was done in an earlier study (SMEC, SAP 2019) after proper identification of erosion processes and hydraulic phenomena, including water surface and velocity profile inside gully channel. Comparison was made in the existing and stable slope. The unstable section of gully is designed to be provided with check dams to stabilize flow and promote sediment deposition upstream of check dams. Check dams are designed for 10-year return period design floods and their stability is checked for a 25-year return period. Generally, over 50 Gabion check dams (Plate 4.7), differing in size, are to be provided in Pilot sub watersheds of the Challawa Gorge Dam.

Gullies with relatively stable slopes will be provided with embankment filled sediment traps at their outlet locations. Theses sediment traps will serve to trap sediments which come from agricultural land until the agricultural and bio remediation erosion control measures fully develop and reduce sediment. Four sediment traps at the outlets of finger gullies are also to be provided in the two pilot sub watersheds. Each sediment trap is equipped with a rock riprap (Plate 4.8) overflow spillway and concrete pipe dewatering orifice. The spillway is designed to pass the 25-year return period design flood while the orifice is designed to empty the 10-year design flood volume in 24 hours.

## 4.4.6 Gully Bank Treatment with Bio-Remediation and Agricultural Measures

On eroded banks of gullies and adjacent agricultural lands, bio-remediation and agricultural erosion control measures are to be provided. Gully banks and steep agricultural lands are proposed to be protected with provision of bio engineering (Bio-remediation) and agricultural erosion control measures respectively. Bio remediation focuses on provision of vetiver grass on eroded gully banks with trimming and grading steep gully banks prior to planting, while the agricultural measures focuses on controlling soil loss from the agricultural lands with provision different agricultural practices such as terracing and strip cropping measures. The following subsections discuss these two major erosion control measures and their preference in the Challawa Gorge Dam pilot sub watershed areas. Slopes of gully banks are proposed to be graded with the following:

i. Provision of graded slope of 1:1.5 with 4m wide berm (i.e. a flat strip of land, raised bank, or terrace bordering a river or canal) at the middle of the bank. The proposed graded bench is horizontal and along the contour and interceptor drainage is provided every 10m elevation interval in order to intercept the storm water and evacuate to the collector drain.

ii. Provision of bio-degradable geo matt on the treated surface where the gully slopes are steep and exposed the geo-matt will create a support of the banks until the bio-remediation is fully developed.

However, even with these bank stabilizing measures, the gully banks may still be vulnerable to further erosion by uncontrolled surface storm water runoff from the surrounding areas. Hence, additional protection measures are to be provided. After careful analysis of various types of bank protection measures, vetiver grass and agricultural measure were selected as most suitable options. while the agricultural measures are to complement vertiver grass focusing on controlling soil loss from agricultural lands by implementing agricultural practices such as contouring, strip cropping and conservation tillage involving the community and in close consultation with farmers.

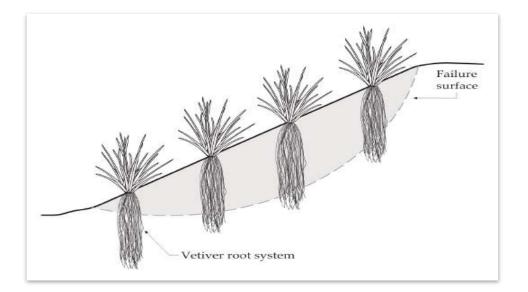

#### 1. Vetiver grass

Vetiver grass is a perennial and fast-growing grass growing up to 2 metres high with roots stretching down to 3 metres deep in the ground (Plate 4.9; Plate 4.10; Fig.4.12; and 4.13). The vetiver vegetation is being used as a natural and effective bio-engineering tool to control erosion and stabilize slopes against sheet flow erosion. It has a strong dense and vertical root system and grows in extreme climatic and environmental conditions. Vertiver grass is proposed to be planted on eroded gully banks by trimming and grading steep gully banks prior to planting.

The vetiver grass can grow on deep sandy soils, under humid conditions and can survive in more than 700 mm rainfall. The whole plant is a Culm, i.e. aerial or above-ground stem of a grass or sedge), from leaf to roots. It displays a high level of tolerance to soil acidity, salinity and acid sulphate conditions. It grows quickly and becomes established under hostile conditions. The very deep and extensive root system provides structural strength in a relatively short period. The main disadvantage of Vetiver is its intolerance to shaded areas, particularly during its establishment phase.

Plate 4.10Vertiver Grass: For Soil stabilizer and erosion and sediment flow controlSource: Accessed on June 15, 2021 at www.riparian+buffer+zone+definition&sxsrf

**Figure 4.12:** Schematic Representation of Soil Reinforcement by Vertiver Grass roots to Minimize Source: Accessed on June 15, 2021 at *www.riparian+buffer+zone+definition&sxsrf* 

Plate 4.11 Vertiver Grass Planting on Riverbank Source: Accessed on June 15, 2021 at *www.riparian+buffer+zone+definition&sxsrf* 

Some other special characteristics that make it suitable for erosion control is that:

- a. Given its extraordinary root depth and strength, mature vetiver is extremely resistant to washout from high velocity flow.
- b. The mean tensile strength of vetiver is about 75 Mpa at 0.7mm-0.8 mm root diameter which is common size and so its roots have been proven positive for slope reinforcement which means the increase in shear strength of soil.
- c. On steep slopes (30-60 degrees), the vetiver spacing between rows at 1m vertical interval is very close and therefore the grass moisture uptake would be greater to offset the increase in infiltration and further improve the slope stabilization process. However, to enhance the use of vetiver on the steep slopes in very high rainfall areas, a precautionary measure is to plant vetiver hedges on a gradient of about 0.5% as in graded contour.
- d. Vetiver roots can penetrate a compacted soil profile providing a good anchor for fill and top soil. Vetiver's extensive and thick root system binds the soil which makes it difficult to dislodge.
- e. When planted closely together Vetiver plants forms dense hedges that reduce flow velocity, spread and divert runoff water and create a very effective filter that control erosion.
- f. Acting as a very effective filter, Vetiver hedges reduce the turbidity of surface runoff. Since new roots develop from nodes when buried by trapped sediment, Vetiver continues to rise with new ground level and terraces form at the face of the hedges. The fertile sediment typically contains seeds of local plants which facilitate their re-establishment.

2. Vetiver Nursery The success using vertiver grass in this project would depend on good quality and sufficient numbers of Vetiver slips/tillers. The community nursery individual farmer households can set up vetiver nurseries. The nursery owners will be contracted (as out-growers or contract farmers) and paid by the project for supply of veriver seedlings (and therefore serves as a source of income for participating farmers). For effective planting at field, the local people can also be encouraged to participate in raise awareness and ensure the slips/tillers protection from animals. Nurseries will require more care to ensure good growth and multiplication of the slips/tillers. Participation of the locals is important for sustainability as they become partners' in ownership of the project. Due to the large volume of vetiver plants required, it is recommended to have one nursery per gully. This strategy will reduce transport costs and allow local communities to participate in the nursery enterprise while it also allows for some degree of equitable participation of the local community throughout the project area. Most of the proposed seedlings will require at least four months maturing (to be ready for planting). The establishment of these nurseries must therefore start immediately alongside start of construction. Planting time. Vetiver generally needs 3-4 months to become established and is fully effective at the age of 9-10 months. Mass planting should follow the construction schedule. If it occurs during the dry season, the contractor should provide adequate watering. If during the rainy season, the plants should be protected with synthetic mats. In both cases protection from animals is necessary.

## 3. Suitable Period for Planting

Planting should follow the proposed work schedule. However, if planting occurs during the dry season, adequate watering should be provided by the contractor. The following points should be considered in the implementation of Vetiver grass:

- Spacing of Vetiver rows varies from 50-200 cm and depends on the soil conditions.
- Drainage system i.e. interceptor ditch and drain chute are also necessary.
- The planting rows spacing can be 50-100cm apart in erosion prone areas and 1-2m in areas less vulnerable to erosion.
- In order to achieve better performance of Vetiver for civil work protection, planting can be done along with civil works with less interference between them. Planting can be started at an early stage in stable locations of the buffer areas.

## 4. Layout Specifications

To stabilize the gully slope, the layout specifications are as follows:

- Gully slope should not exceed 1H: 1V or 45 deg. Shallow gradients are recommended whenever possible, especially on erodible soil and or in high rainfall area.
- Vetiver should be planted across the slope on contour lines with a vertical interval between 1m-2m apart, measured down the slope. Spacing of 1m should be used on highly erodible soil, which can increase up to 1.5-2m on more stable soil.
- The first row should be planted on the top edge of the batter and the bottom row at the bottom of the slope. Between these rows, Vetiver should be planted as specified above.
- Benching or terracing 1-3m in width for every 5-8m vertical interval is recommended for slope that is taller than 10m.

## 5. Planting specification

The procedures for planting the Vetiver:

- Vetiver requires a clean and moist field;
- The contour lines shall be prepared before planting the tillers and then a trench (15-20 cm deep & wide) should be prepared to place the Vetiver.
- If the plants are from poly bags, tear the poly bags;
- Dip the root part in dung/slurry (soil manure mixture) to initiate the first development of roots.
- Plant 3-4 tillers per station along the contour at an interval of 5-10cm when the ground is wet and moist.
- Cover roots with 20-30mm of soil and compact firmly, fertilize with nitrogen and phosphorus and water within the day of planting.

## 4.4.7 Riparian Buffer Strip

The other source of sediment for Challawa Gorge Dam Reservoir is from the surrounding adjacent agricultural lands and from stream bank erosion in the upland watershed as non-point sources. These non-point sources are to be treated by providing vegetated buffer zones. Buffer zones refer to lands directly adjacent to water bodies such as reservoirs and streams. These areas have a significant impact on controlling non-point source pollution by trapping suspended sediments and stabilizing stream banks. The ability of buffer strips to meet specific objectives is a function of their position within the watershed, the composition and density of vegetation species present, buffer

width and length, and slope. Accordingly, in this project, 15m and 30m wide vegetated buffer zones are to be established along the main streams banks of the Watersheds and around Challawa Reservoir area respectively.

The Riparian buffer (fig.3.2) shall consists of an area of trees and other vegetation located in areas adjoining and up gradient from surface water bodies and designed to intercept surface runoff, wastewater, subsurface flow, and deeper groundwater flows from upland sources for the purpose of removing or buffering the effects of associated nutrients, sediment, organic matter, pesticides, or other pollutants especially from agricultural activities, prior to entry into surface waters and groundwater recharge areas. The three vegetated riparian buffers zones, shall include a zone of stabilization at the stream edge, a tree and shrub area, and an area of dense grasses. The first zone next to the stream should be 15 feet wide, measured perpendicular to the stream to be comprised of the tree shrub vegetation used in stream stabilization. The second zone consists of an area with a minimum width of 60 feet, measured wide and on the land side of the first zone. It consists of trees, shrubs, and their litter of leaves and branches as an energy source to capture agricultural chemicals that pollute streams.

## i. Width of Riparian Buffer

Buffer width, as defined herein, is measured beginning at the top of the bank or level of bank full discharge. Width recommendations for buffer strips are either fixed or variable in nature. Fixed-width buffer strip recommendations tend to be based on a single parameter or function. Therefore, in the design of stream buffer zone for Challawa Gorge Dam Pilot sub watershed the objective is single and clearly defined. It is planned to protect the stream bank erosion.

| Function             | Description   | Recommended width |
|----------------------|---|-------------------|
| Stream Stabilization | Riparian vegetation moderates soil moisture<br>conditions in stream banks, and roots provide tensile<br>strength to the soil matrix, enhancing bank stability.<br>Good erosion control may only require that the width<br>of the bank be protected. | 10 to 20m         |

There are many factors that influence the effectiveness buffers. These include slope, rainfall, and the rate at which water can be absorbed into the soil, type of vegetation in the buffer, the number of impervious surfaces, and other characteristics specific to the site. Based on the recommendation given in Guidelines and the actual site condition, the nature and extent of bank erosion in the specific site a stream buffer width of 15m on both side is provided in both Pilot 1 and 2, as shown in Figure 3.2 below:

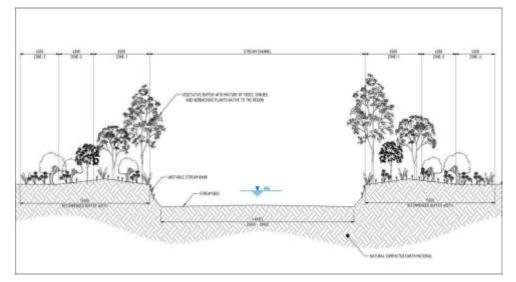

Figure 4.13: Proposed three-zones forest buffer width for Pilot Watershed 1 and 2

The 15m buffer width proposed has three different zones each having different vegetation planning and purpose. The vegetation planning is discussed in the following section.

## ii. Vegetation planning for stream buffer zones

Most of the focus on buffer design is the needed width; however, the vegetation assemblage, layout, and length are also key design parameters. The riparian buffer planting will have a direct relationship with the design and vegetation selected for the planting. Trees, shrubs and grasses vary in the kinds of benefits they provide to the buffer structurally. diverse riparian buffers, i.e. those that contain a mix of trees, shrubs and grasses, are much more effective at capturing a wide range of pollutants than a riparian buffer that is solely trees or grass.

The most effective riparian buffers should include a mix of trees, shrubs and herbaceous plants native to the region and appropriate to the environment in which they are to be planted. When planting buffers, it is best to use adjacent reference riparian buffers as the basis for selecting floral composition. Since different vegetation have different benefit in buffer zone, careful selection of

riparian vegetation is essential. Figure 7.8 shows the relative effectiveness of these different vegetation types in providing a variety of benefits. For stream buffer strips designed for Pilot sub watersheds, the width of buffer is divided in to three zones as shown in Figure 4.14. Vegetation composition of each riparian buffer zone is explained below along with their objectives:

## <u>Zone 1.</u>

This zone begins at the stream edge and is the area that provides streambank stabilization and bank erosion protection as well as habitat for terrestrial animals. Primary functions of this zone include provision of shade helps reduce flood effects, stabilize stream banks, and remove some sediments and nutrients. Vegetation should be composed of native, non-invasive trees and shrubs of a density that permits understory growth; it should also tolerate frequent inundations. The width of this zone typically varies between 5 and 8 m or more. In this specific design considering the objectives and practicality it is designed to be 6.5m.

#### <u>Zone 2.</u>

This zone extends upslope from Zone 1 from a minimum of 3m up to 5m, depending on objectives, stream type, soil type, or topography. The objective in this zone is to provide a managed riparian forest with a vegetation composition and character similar to natural riparian forests in the region. Therefore, a width of 4m is provided. Species of vegetation used in this zone should be reasonably flood- and drought-tolerant. The primary function of Zone 2 is to remove sediments, nutrients, and other pollutants from surface and groundwater.

## <u>Zone 3.</u>

This zone typically contains grass or herbaceous filter strips and provides the greatest water quality benefits by slowing runoff, infiltrating water, and filtering sediment and its associated chemicals. The minimum recommended width of Zone 3 is 4.5 m when used in conjunction with Zones 1 and 2. The primary concern in this zone is initial protection of the stream from overland flow of pollutants such as herbicides and pesticides applied to agricultural fields. Properly designed grassy and herbaceous buffer strips may provide quality habitat for several upland wildlife species.

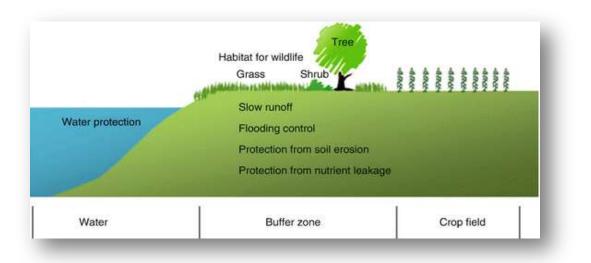

Figure 4.14 Typical Riparian Buffer Vegetation Zoning for Erosion and stream water quality control Source: Accessed on June 15, 2021 at *www.riparian+buffer+zone+definition&sxsrf* 

The first zone next to the stream should be 15 feet wide, measured perpendicular to the stream. The second zone consists of an area with a minimum width of 60 feet, measured wide and on the land side of the first zone. It consists of trees, shrubs, and their litter of leaves and branches as an energy source to capture agricultural chemicals that pollute streams. Livestock are to be restricted from zones one and two. Maintenance of zones one and two, especially after very high stream flows, is necessary. Zone three should be approximately 25 feet wide and contain natural grasses. This zone is an important area for infiltration of water during heavy storms. Livestock grazing over zone three should be limited to ensure adequate grass cover.

Specifically, riparian buffers provide the following benefits:

a. Water Quality Protection: Pollutants and nutrients from pesticides, fertilizers, and livestock practices can leach from farmland and be transported in surface runoff, which may damage aquatic ecosystems. Riparian buffers are physical barriers between streams and developed land, which trap these pollutants and decrease their harmful effects. Nutrients found in most fertilizers and animal waste—nitrogen and phosphorus—often bind to soil particles causing them to be trapped in the buffer. Once in the soil, both microorganisms and plants transform these pollutants into less harmful forms and/or store them as biomass. Specifically, it has been found that 50-100% of the sediments and nutrients can be trapped or absorbed in riparian buffers

- b. Bank Stabilization and Erosion Control: Plant roots grow down into stream banks, creating a complex system that holds soil and makes the bank more secure and stable.
   Plant stems and other debris work to deflect the cutting action of water from high stream flows and runoff, which decreases erosion
- c. *Shade and Wildlife Habitat*: Aquatic habitats are improved by increasing water quality, steadying water flow, and introducing shade. Shade produces regions of cooler water, which can hold more oxygen and lead to reduced stress on aquatic organisms. Additionally, the buffer acts as a source of woody debris that provides shelter for fish, invertebrates, and amphibians, provide habitat for various terrestrial species like water fowl, nesting animals, and browsing herbivores, as well as cover for predators, thus promoting ecosystem biodiversity.
- d. *Groundwater Recharge and Flood Control:* Buffers work to slow the rate at which water enters a stream or river. This prevents surface runoff from entering the stream too quickly and allows water to percolate into the soil. The reduction of fast-flowing water decreases the chances of flooding while allowing more water to be transferred into the ground, thereby recharging the groundwater.
- e. Helps cool the stream temperature, which improves insect and fish habitat.
- f. Establish complex root system from trees, shrubs, and grasses, which helps retain soil.
- g. Naturally removes phosphorous and nitrogen products from runoff water.
- h. Increases infiltration of water into the soil and slows the runoff.
- i. Decreases stream sediment load.

## 4.4.8 Agricultural erosion control methods component

This section provides a brief description of basic agricultural erosion control methods proposed to be used within agricultural lands of the Watershed. As the major land use in the watershed is agricultural land for subsistence farming, the provision of farm erosion control measures targeting small holder farms is desirable. Several types of farm level erosion control techniques have been developed to fit soil, climate, crop, and socioeconomic conditions around the world. Local sources have been consulted for information on indigenous knowledge about techniques proposed in the area to protect land against erosion.

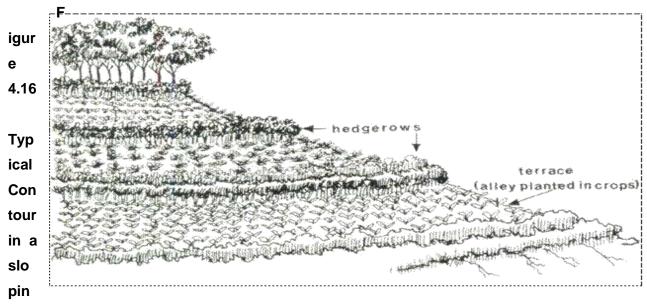

When an erosion problem is identified in a watershed, there is usually effort to develop and implement a "soil conservation" program. However, this top-down approach has largely been ineffective against erosion, as evidenced by the failure of projects of this type worldwide. Farmers control the use of the land they till, and are rarely willing to implement costly soil conservation measures, or change their production practices, unless there are tangible benefits to themselves and their families. The application of structural erosion-control measures on subsistence farmers

has often been unsuccessful; the measures have not been maintained, and in some cases, they were even dismantled by the people they were supposed to benefit.

This and other similar experiences noted in the literature underscore the importance of the socioeconomic aspect of erosion control and involvement of the local people. An important challenge is to develop conservation practices that not only reduce erosion but also increase land productivity. Successful erosion control projects will focus on practices that improve the farmer's condition while simultaneously conserving soil and water. Conservation measures are most likely to be profitable, and thus implemented, when they are cheap and simple, or, when they allow improved agronomic practices to be implemented. Even when the principal impact of soil loss is offsite (such as Challawa Gorge Reservoir), the farm-level approach is still appropriate because conservation measures must be implemented and sustained by farmers themselves. Accordingly, the following farm level erosion control measures are designed to tackle soil erosion and increase productivity in the farm level with in the pilot sub watersheds.

# i. Erosion Control measures on Farm:

- a. Contouring: The practice of orienting field operations such as ploughing and planting along the contour is called contouring. It reduces surface runoff by trapping water in small depressions and decreases the incidence of rill formation. Contouring is proposed in steep cultivated lands of the watersheds with slope exceeding 5%. Contours are level lines across a slope at a constant elevation.
- b. *Vegetative barriers* (such as grassy strips) will be located on the contour to control soil erosion. Water flowing down the slope picks up soil and when it reaches a contour barrier it slows down, the soil particles settle out, and more water enters into the soil.

#### g agricultural farm land

Source: Adopted from SMEC, 2019), p.61.

c. Strip Cropping: The practice of growing alternate strips of different crops in a field is called strip cropping. For water erosion control the strips may be aligned along the contour and the crops follow a different rotational sequence so that the entire field is never bare. Buffer strips may also be used to protect sensitive areas of the field from erosion, or to create areas which will retard runoff and trap sediment. Strip cropping used as a technique for erosion control is a most effective method in certain soils and topography. This method becomes more effective for erosion control, when it is followed with crop rotations in the area where terraces are not practically feasible due to the fact that the length of slope is divided into different small segments.

The strip crops check the surface runoff and force them to infiltrate into the soil, thereby facilitating conservation of rain water. Strip cropping is a more intensive practice for conserving the rain water than contouring (i.e. about twice as effective as contouring) but it does not involve greater effect on soil erosion as terracing and banding. Generally, the use of strip cropping practice for soil conservation is decided in those areas where length of slope is not too long and where it will be encouraged for rain water harvesting considering water scarcity in the area.

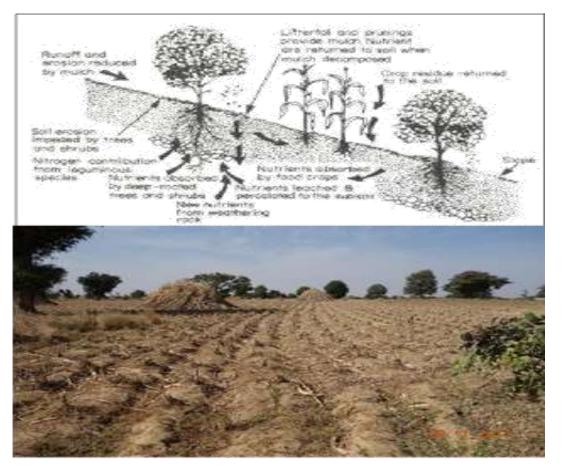

Figure 4.12: Proposed Strip Cropping and Existing farming in the watershed adopted from SMEC (2019)

d. Conservation Tillage: One of the most important agricultural conservation measures being adopted in many areas of the world in recent years is the reduction in tillage (turning of the soil). Under conservation tillage, the crop stubble is left standing and residue is evenly spread across the field as mulch instead of being ploughed under. Weeds are controlled by cutting and herbicide. Compared to conventional tillage, conservation tillage can increase soil organic matter, reduce erosion by as much as 90 percent, enhance infiltration, and reduce moisture loss. When implemented across a watershed, the enhanced infiltration can reduce peak discharge and downstream flood damages. The most important, from the standpoint of sustained implementation, are the tangible short-term benefits to the farmer.

e. *Terraces*: The use of terraces is an ancient technique. Terraces work against gravity, interrupting the tendency of water to flow down- slope. The layout and configuration of terrace systems or earthen bunds will depend on the farming system, soils, crops, climate, etc. Terraces are normally designed to discharge the collected runoff to a lined channel or drain which carries excess water downslope. Because structural terraces collect and concentrate water, the failure of a terrace can release a concentrated flow of water which can cause gullying. While terraces can be highly efficient at trapping both soil and water it is required for sustained production on steeply sloping soils, structurally formed terraces of earth or stone are costly to construct and maintain.

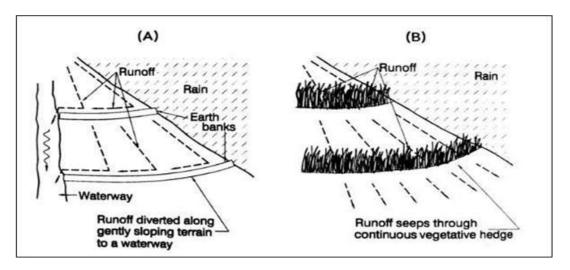

Figure 4.18: (a) Terraces using structural terraces (b) and contour stiff grass hedge (b) Source: Adopted from SMEC (2019

Because structural measures are costly to construct and will fall into disrepair and fail without continual maintenance, considerable attention has been given recently to the use of self-sustaining stiff grass hedges. It is also recommended to use stiff grass hedges in Challawa Watershed by planting a dense hedge of stiff grass on the contour, which retards runoff and causes water to pond and deposit sediment on the uphill side of the hedge. Because it is living, the grass hedge will become stronger with time and can grow as sediment collects and the terrace height increases. Deposited sediment fills in low spots, runoff tends to become more evenly dispersed and less erosive with time, and the hedge tends to naturally build terraces that follow the contour.

### **4.5 Construction Activities**

The construction activities shall be handled by competent professionally skilled contractor to handle the Engineering, Bio-engineering and Agricultural components of the project. The project proponent i.e. the Hadeja Jamaare Komadugu Yobe Basin Trust Fung (HJKY-TF) is not equipped technically and professionally to execute the construction work due to absence of the required manpower. Thus, the contractor may have to import professionally skilled man power from outside the project area while some component of the unskilled labour input may be attracted from the local communities of the project area. The contractor must consider and apply legally binding labour regulations of the country including minimum wage standards and in accordance with global best practices.

Construction material both physical and biological available in the project area is inadequate and must be provided from outside the project area. While rock materials may be carefully mined from the local environment that is charaterised by rock out crops and granitic beds for the construction, the extraction of such materials must be done considering environmental sustainability with minimum encroachment on farmlands or developed areas and without further damaging gully prone sites. Veriver grass seedlings may have to be raised in nurseries and natured for transplanting. Vertiver grass can grow over a short period of 45 -60 days with good husbandry practice. However, vertiver seeds may not be available within the project area and must be acquired from outside the watershed region.

Subsisting land tenure laws of the country described in section 2.2 of this report is to guide land acquisition for the project and where necessary adequate compensation should be granted all affected land owners/user for any land and or crops affected by the project. The more likely groups to be affected directly and indirectly by watershed remediation activity are the members of the local community (land owners, farmers, animal herders etc.) in the project area especially in Rogo, Karaye and Kiru Local Government Areas of Kano State.

# 4.6 Activity Phases

Project activities are phased for ease of construction and monitoring progess. The phases are discussed under the following sub-headings:

- Mobilisation or preconstruction phase,
- Construction phase,
- Operation/Maintenance Phase, and
- Decommissioning phase

The proposed project involves Gully bank stabilization, erosion control, sediments control on main and some of the Challawa river tributaries and ecosystem enhancement of the Challawa Gorge Dam watershed.

# 4.6.1 Preconstruction (mobilization) Phase)

This phase entails mobilising labour force, equipment, materials and acquisition of various permits as required by the country laws and AfDB guidelines. Other activities during this phase include topographical survey, hydrological survey, geotechnical investigation, identification of sources of construction materials, such as rocks for gabions, riprap, sources of vertiver grass, required tree species and seedlings, land for raising trees and vertiver grass nurseries, storage etc. (Table 4.7).

# i. Duration

The mobilisation activities are expected to be achieved within one to two months of project inception. Types, Quantities and Sources of material requirements during the preconstruction phase of the project are shown in Table 4.8.

| Requirements    | Туре                  | Source                            | Estimated Quantity     |
|-----------------|-----------------------|-----------------------------------|------------------------|
|                 |                       |                                   | Required               |
| Raw Materials   | Rock boulders         | From the nearby existing          | 64,000m <sup>3</sup>   |
| (inorganic)     |                       | commercial quarries               |                        |

# *ii.* Transportation of equipment and materials

Materials necessary for the construction works will be transported by trucks to the construction site including cement and reinforcement bars, rocks etc. will be transported by Lorries to the construction site.

# iii. Storage

All materials will have to be stored at the designated laydown areas onsite and adequate security to be provided. Fuel/oils will be stored in drums, which shall be kept in bunds (well-paved areas that do not allow fluids to come in to contact the soil).

# 4.6.2 Construction Phase

The major construction activities, requirements and estimated cost are highlighted in Table 4.9.

# • Duration:

The duration of this phase will be one (1) year.

| ltem    | Description  | Amount (N)       |
|---------|--|------------------|
|         | A. Earthwork and Excavation  |                  |
| 1.      | Clearing of Site   | 8,512,434.06     |
| 2.      | Excavate over site to strip topsoil a maximum depth of 150mm       | 48,642,480.35    |
| 3.      | Excavate any material except rock in cuttings and lined drains     | 8,711,264.77     |

# Table 4.9: Project activities summary of requirements and estimated capital cost<sup>#</sup>

<sup>#</sup> Estimates from SMEC 2019 Report Vol. 2 Priority Projects Preparation Report: Vol. 1A - Challawa Gorge Dam Watershed Management Project March 2019, pp.95-96.

Overall, it is estimated that the project will cost a total of Naira N6,380,025,488 (US \$20,918,120). Bio-engineering, agricultural measures and buffer strips accounts for close to 80 % (N 5,099,439,126) with the bulk of the cost (N 2,471,799,125.50) going to placement of sand bags and planting of fast growing grass such as vetiver, elephant grass etc. on the slopes. However this does not include cost of operation and maintenance.

# • Transportation of equipment and materials

Materials necessary for the construction works will be transported by trucks to the construction site including cement and reinforcement bars, rocks etc. will be transported by Lorries to the construction site.

# 4.6.3 Operation/Maintenance Phase

The actual usage of the infrastructure is expected to immediately commence after the construction works. The design period is 25 years. However, within the period, there will be routine maintenance of the Dam. Maintaining the trees, shrubs and grasses, monitoring the gabions, riprap and sediment traps. Marketing of fruits from the trees, (avocadoes, mangoes, oranges etc. to raise income. Other activities may include dredging, water supply, routine maintenance of gabions, ripraps, sediment traps, and constant protection of planted trees and grasses from unapproved interference, monitoring and evaluation of project conditions.

# i. Duration

The duration of this phase will be throughout the 25 years life of the protective measures carried out in the watershed.

# ii. Complementary Requirements:

Constant monitoring by the dam authorities, the HKJYB-TF and the HJKYB Authority,

# 4.6.4 Decommissioning Phase

Activities include proper demobilisation and dismantling of unwanted structures and proper restoration of the site. Other activities would include rehabilitation of service facilities and other structures nearer to the original condition, clearance of all sorts of wastes, including used oil, sewage and solid wastes (plastics, wood, metal and papers). All wastes shall be deposited at authorised dumpsites and contracts terminated in accordance with legal contract agreement after fulfilling all terms and conditions of the contract

# i. Duration

Decommissioning stage will last for at least six (6) months.

Types, quantities and sources of project requirements during the decommissioning phase are shown in Table 4.7.

Table 4.10: Types, Quantities and Sources of Project Requirements during the decommissioning Phase

| Requirement            | Туре             | Source                  | Quantity Required   |

#### **CHAPTER FIVE:**

#### DESCRIPTION OF PROJECT ENVIRONMENT AND BASELINE CONDITIONS

#### 5.1 Introduction:

The purpose of the baseline data acquisition was to establish, the status of the various environmental components that are likely to be affected by the proposed project. In order to achieve this, environmental parameters were determined from literature survey, fieldwork, laboratory and data analyses. The components of the environment evaluated covered biophysical, social and health. The ESIA study of the project incorporated data from already approved Environmental Impact Assessment reports as secondary data which include amongst others, the Challawa Gorge Dam Rehabilitation Project Strategic Action Plan 2019, and the ESIA for the 330/132/33kV Transmission Substation New Kano, Kano State.

The Challawa Gorge Dam Management project is designed to be carried out in three pre-selected areas which are typically representative of the entire sub-watershed in terms of physical (topographic, drainage, soil and vegetation) as well as their human occupancy, land use and agricultural practices. The details of Pilot sub-watershed selection process are clear defined in an earlier Strategic Action Plan Report for this project (SMEC 2019, Volume 1 A). The general environmental, ecological and social conditions of the project site made up of (i) Dam Site, (ii) Pilot Sub watershed\_1 (PWS\_1) and (iii) Pilot Sub-watershed\_2 (PWS\_2), are described below. The Project Area of Influence (AOI) i.e. the geographic area likely to be affected by the project is also highlighted.

#### 5.2 General Overview of Conditions of Project Sites

The pilot catchment management sites are located in a remote area which has an undulating and heavily rugged topography (Plate 5.1) with isolated hills. The area is situated within the southern guinea savannah region, with two distinct climatic seasons; wet and dry seasons. The area receives plentiful sunshine all year round, ranging from 11 to 13 hours per day.

The main river that drains the area is River Challawa. The river is seasonal and the quantity and quality of the water reduces drastically during the dry season. The flow of water from the dam is regulated to allow water flow downstream during the dry season for domestic use and irrigation farming. The water for domestic use at Kano is pumped to Panshekara, at the outskirts of Kano where the water treatment plant is located. The irrigation component is yet to be developed.

Recently, the Kano state government announced expansion of use of the dam to cover power generation, with some slight modification of the dam required to accommodate the power plant.

Plate 5.1: Topography of the Project Sites (Credit, SMEC Report, 2019, P. 75)

The soils surrounding the sites are of different types and can be generally classified as sandy in nature and relatively deep in most places, as evinced at the gully sites, though there are isolated small rocky outcrops scattered around the two sites. A cursory look at farm lands also reveal that the soils are mostly sandy loamy because of the various management practices put in place by the farmers including intensive cultivation without fallow period, ploughing, application of farm yard manure etc., to improve soil for better crop harvest (Figure 5.2). There are a few boreholes and several tube wells located within the nearby settlement and along the roads, for both domestic and agricultural use. The existing land use of at the pilot sites are mainly agriculture for both crop farming and animal husbandry. Other minor land uses are settlements, roads, and for social services like schools, health care centres and open play grounds. The crops produced include maize, guinea corn, groundnuts, beans, soya beans, rice, potatoes, sugar cane, cassava, and other vegetables such as tomatoes, onion and pepper. The animals (usually few in number) raised by individuals include cows, goats, sheep, horse and donkeys. At the settlements, poultry such as fowls, chickens, turkey and ducks were found roaming around freely.

Plate 5.2: Topographic and Soil type observation around Ayaga Kwari area of PSW\_1 (Source: Field Visit guided by Mai'unguwa of Ayaga Kwari Community, Thursday September 2, 2021 12:29 AM)

There are also several species of birds, reptiles, snakes, insects, rodents (like rats and squirrels) observed in the project area. The Rivers and the reservoir provide habitation for fish during the rainy season which allows fishermen to make business by selling, smoked fish and fried fingerlings at markets and highways near the rivers for their livelihood (Plate 5.3).

Plate 5.3: Fried fish (fingerlings on highway near Gumshi River Bridge

# 5.3 Location and Physical Characteristics Project Sites

Tables 5.1 and 5.2 highlight the geographic characteristics of the Pilot watershed for the project.

| Physical Features   | Description   |
|---------------------|---|
| Location            | The location of the pilot sub-watershed 1 is at the boundary of Challawa Gorge Dam      |
|                     | Watershed with location coordinates 368,351.66 m E, 1,285,176.12 m N at the outlet      |
|                     | and 365,887.78 m E, 1,277,604.2 m N at the head of the watershed.                       |
| Watershed Area      | The watershed is characterized with discrete sub-watershed with most characteristics    |
| and Characteristics | representative of the general watershed. The watershed area for this pilot watershed    |
|                     | is 3,150 ha with regular shape and appropriate density of streams network.              |
| Topography and      | The topography of the watershed is rolling in nature and with average slope of 1.5%     |
| Watershed Slope     | and generally suitable for agriculture. However, it gets steeper towards gully banks.   |
|                     | The streams have bigger slopes in some sections with significant contribution for       |
|                     | erosion.  |
| Land use and Soil   | The land use is mainly agricultural land cultivated by individual farmers and has       |
| type                | characteristics representative of the entire watershed. Predominantly the soil is sandy |
|                     | loam which has high infiltration and low runoff potentials.                             |
| Erosion nature and  | The nature of erosion is pronounced in the area of which encroaching towards the        |
| size                | agricultural land and eroding stream banks. The extent of erosion in this pilot sub-    |
|                     | watershed is representative of the general watershed area.                              |

| Table 5.1: Location and Physic | al Characteristics of PWS 1 |
|--------------------------------|-----------------------------|
|--------------------------------|-----------------------------|

| Physical Features   | Description   |
|---------------------|---|
| Location            | The location of the pilot sub-watershed 2 is at the boundary of Challawa Gorge Dam      |
|                     | Watershed with location coordinates 362,484.24 m E, 1,266,563.85 m N at the outlet      |
|                     | and 358,590.13 m E, 1,259,559.41 m N at the head of the watershed.                      |
| Watershed Area      | The watershed is characterized with discrete sub-watershed with most characteristics    |
| and Characteristics | representative of the general watershed. The watershed area for this pilot watershed    |
|                     | is 2,661 ha with regular shape and appropriate density of streams network.              |
| Topography and      | The topography of the watershed is rolling in nature and with average slope of 1.5%     |
| Watershed Slope     | and generally suitable for agriculture. However, it gets steeper towards gully banks.   |
|                     | The streams have bigger slopes in some sections with significant contribution for       |
|                     | erosion.  |
| Land use and Soil   | The land use is mainly agricultural land cultivated by individual farmers and has       |
| type                | characteristics representative of the entire watershed. Predominantly the soil is sandy |
|                     | loam which has high infiltration and low runoff potentials.                             |
| Erosion nature and  | The nature of erosion is pronounced in the area of which encroaching towards the        |
| size                | agricultural land and eroding stream banks. The extent of erosion in this pilot sub-    |
|                     | watershed is representative of the general watershed area.                              |

# 5.4 Area of Project Influence (API)

The area of Potential Project Influence (API) both direct and indirect is identified in terms of coverage or extent of the impact, is determined as the degree, extensiveness or scale of influence. The Project's API is the geographic area where direct or indirect impacts are likely to be experienced. In other words, areas where primary or secondary effects resulting from the project are likely to happen.

Overall, the Challawa Gorge dam watershed covers an area of 3,842 km<sup>2</sup> but the measures proposed cover two pilot sub-watersheds with a total area of 3,150 ha (about 31.50 Km<sup>2</sup> or about 0.82% of the watershed) for pilot\_1) and 2,661 ha (26.61km<sup>2</sup> or 0.69% of the watershed) for Pilot \_2. The API is estimated base on three considerations in terms areal extent from the end point of buffering/bioremediation, i.e. from a maximum of 60m from Reservoir and gulley banks which make up the footprints of the erosion control measures. viz:

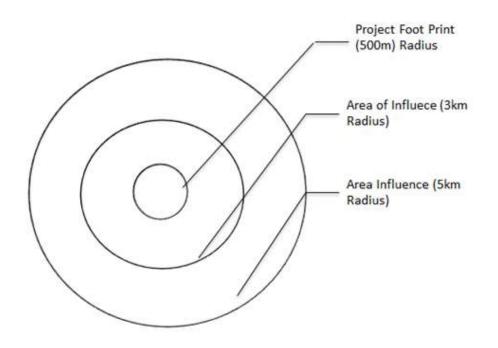

- d. On site (within  $500m^2$ )
- e. 3 km-5km<sup>2</sup>
- f. Beyond 5 km<sup>2</sup>.

Thus the area of influence is expected to go beyond 5km from the project footprint which includes the 1458 Ha covered by the direct project, out of which 500 Ha will be on farmlands belonging to individual farmers. All project activities will be carried within the footprint area defined below.

- Around reservoir (475 Ha) at 60m from Reservoir embankment;
- In Pilot area \_1 (276 Ha) along gully banks, at 30 m-60m from gully banks;
- In Pilot area (218 Ha along gully banks, at 30 m-60m from gully banks;
- In Buffer strips in Pilot area\_1 and Pilot area\_2 (covering 16 Ha), along main and finger gully banks, at 15m-30m from gully banks; and
- On farmlands (500 Ha).

The Project's Areas of Direct Influence (ADI) within and outside of the footprint area includes the biophysical and socioeconomic impacts. The Project's ADI is therefore demarcated as in figure 5, a schematic representation of the areas of influence. The influences can be categorised into two: Biophysical and Socioeconomic influences. Figure 5.1 provides a graphical illustration of the Areas of Influence.

- Biophysical environment: it is expected that all direct and indirect biophysical influences
  resulting from project development and operation may not extend beyond the 3km radius
  from the project footprint. This extent would experience temporary movements of men,
  machines, equipment and materials to project sites; top soil excavations and movement;
  temporary disturbance to both land and water species habitats etc. Beyond the 500m
  radius of the project footprint direct biophysical impacts are unlikely to be experienced. Any
  such effect felt beyond the 3km distance may be regarded as secondary.
- Socioeconomic environment: Socioeconomic influences of the project are expected to be \*directly felt by the persons residing or working within 0.5km - 3km radius of the project footprint on either side of the gulley banks and those around the reservoir both upstream and downstream.

Figure

5.1: Schematic Representation of Project Area of Influence

# 5.5 Geographic and Environmental Settings of the Project

Baseline information describes the general physical and socioeconomic conditions of the project environment.

# Sampling Procedure

The sampling procedure was established during Scoping. These measurements were made in situ to establish the Environmental Baseline:

- Meteorology
- Air Quality and Noise
- Soil, Land use and land cover
- Vegetation and Wildlife
- Geology/Hydrogeology
- Surface water
- Socio-economics
- Health

The Sampling Specifications are presented in Table 5.3.

| S/N | SAMPLE        | SAMPLE TYPE/DURATION                                    |
|-----|---------------|---|
|     |               |   |
| 1.  | Soil          | Composite : Surface (0-15cm) and Subsurface (15-30cm)   |
|     |               |   |
| 2.  | Sediment      | Grab  |
|     |               |   |
| 3.  | Surface Water | Grab  |

| 4.  | Groundwater   | Grab  |
|     |               |   |
| 5.  | Vegetation    | Transect area   |
|     |               |   |
| 6.  | Wildlife      | Transect/Visual Observation/Interviews                  |
|     |               |   |
| 7.  | Air Quality   | Spot Measurement : Twenty-five (25) minutes per station |
|     |               |   |
| L   |               |   |

Table 5.3 Sampling Specifications

The Federal Ministry of Environment representatives were present during the sampling to ensure that environmental samples were collected and preserved (where necessary) according to recommend procedures and practices for environmental data collection in Nigeria. The environmental components and indices for the Biophysical Baseline Assessment are as presented in Table 5.4.

# Table 5.4Environmental Indices for Biophysical Baseline Analysis

| Environmental            | Environmental         | Data Acquisition           | Potential Environmental Impact Indicator                      |
|--------------------------|-----------------------|----------------------------|---|

### 5.6 Geographic and Environmental Settings of the Project

Baseline information describes the general physical and socioeconomic conditions of the project environment.

### Sampling for Physical Characteristics study

The field sampling program took place in July – August 2020 as shown in table 5.6. Parameters such as temperature, pH, turbidity, electrical conductivity and dissolved oxygen were determined *in situ* because of their rapid change on storage. For other parameters samples which could be subject to microbial degradation and transformation were preserved, stored and analysed at minimum time after collection. This combined Work Plan/Field Sampling and Analysis Plan (FSAP) addressed the field sampling, analytical, quality control, and data review procedures for the collection and analysis of sample.

For Climatic data

### **Samples Collection and Analytical Methods**

Baseline data for the study area were generated using a combination of literature survey, field studies; analysis of maps, review of background project documents; site reconnaissance surveys; structured and semi-structured interviews via engagements with the affected riparian communities, focus group discussions (FGD), Key Informants Interviews (KII) as well as a collection of field baseline data for a number of indicators using in-situ measurement methods.

Part of this section relies on existing data as surveyed from relevant literature sources as well as field study and data analysis. Dry and wet season data were obtained from the extensively available literature (SMEC 2019; SMEC, 2015 ESIA for the Proposed 330/132/33kV Transmission Substation New Kano, Kano State Olofin 1987; Waziri, Zakaria and Audu 2015). Since the ESIA study is a one-season (rainy season) study, field sampling survey was used to generate current information (rainy season) for the project area. Dry season data were derived from similar approved ESIA report for the region (Kano Region) (SMEC, 2015)

For the purpose of both physical and socioeconomic sampling, a system of square grids was superimposed on the study area to randomly select sampling locations for air, water and soil studies. A total of 20 sites were sampled in the three project areas namely PSW\_1, PSW\_2 and Dam Site. However, samples were collected from 10 sampling points around PWS\_1 and the Dam site. The PWS\_2 sites could not be visited due alleged prevailing insecurity associated with banditry in the remote area. Samples were therefore collected around 10 village areas

including Rogo, Turawa, Sakarma, Daura Gari, Yola, Gumshi, Dam Site, Jerre and Challawa. Locations of the sampling points with their coordinates are presented in the Plate. 5.6 and Table 5.5 below.

| S/N | Sample site | Latitudes (X) | Longitudes (Y) | Sampling Locations/Area |  |
|-----|-------------|---------------|----------------|-------------------------|--|
| 1   | SS1         | 11°46'17.73"N | 8° 1'42.71"E   | Karaye                  |  |
| 2   | SS2         | 11°47'24.93"N | 8° 7'27.15"E   | Outside-Community       |  |
| 3   | SS3         | 11°37'19.10"N | 7°53'14.77"E   | Rogo                    |  |
| 4   | SS4         | 11°45'4.73"N  | 7°57'18.74"E   | Ganji                   |  |
| 5   | SS5         | 11°38'31.06"N | 8° 3'1.67"E    | Sakarma                 |  |
| 6   | SS6         | 11°45'7.30"N  | 8° 6'54.66"E   | Outside-Community       |  |
| 7   | SS7         | 11°36'50.98"N | 7°57'28.42"E   | Daminawa                |  |
| 8   | SS8         | 11°46'26.44"N | 7°58'17.24"E   | Outside-Community       |  |
| 9   | SS9         | 11°42'48.73"N | 8° 2'44.25"E   | Turawa                  |  |
| 10  | SS10        | 11°41'50.65"N | 7°56'52.19"E   | Daura-Gari              |  |

Table 5.5 Sampling Locations

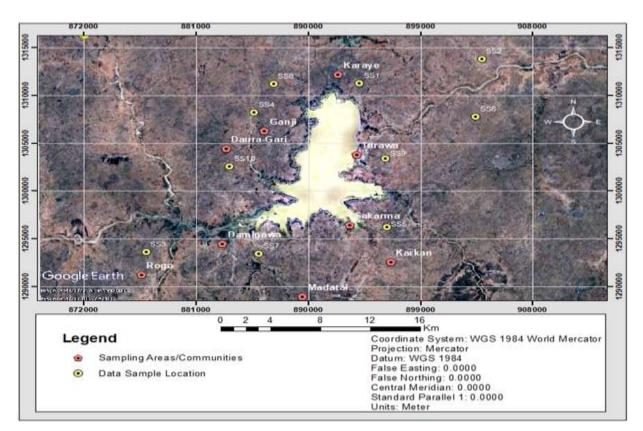

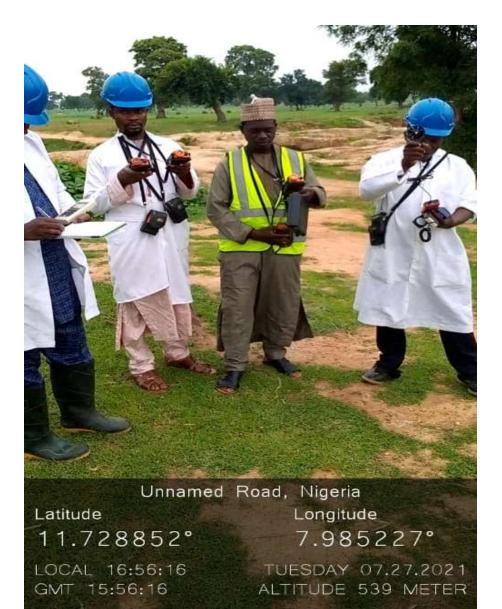

Plate 5.4: Geo-location Pattern of Sampling points

#### 5.7 Air Quality & Noise Studies

Sampling was for a period of eight hours per day with readings of all the parameters determined every hour. The eight-hour monitoring period was carried out from day to day so that reading could be taken from early morning to late at night over the monitoring period. Information on air quality along the route was generated by on site monitoring of air quality at the proposed route locations. This data was supplemented by desk based assessment of historical data from various locations.

Page 146 of 490

Plate 5.4: Air quality sampling station at the location of the proposed Project

#### **Air Quality Parameters**

A Portable AeroQual Series 300 Monitor and a Portable Environmental Sensor meters (ASTM D3249-95) were used. Air was pumped continuously from the atmosphere and a portion of the sample automatically sent to the analyzer for the determination of the gaseous pollutants of interest. The analyzer contains modules of each gas that analyzes the quality of the gases in the ambient air. It is a digital meter, which reads parameters at a time weighted average. (NOx, model Z-1400; SOx model Z-1300; NH<sub>3</sub> model Z-800; H<sub>2</sub>S model Z-900; CO model ZDL-500 all manufactured by Environmental Sensors Ltd and VOC using AeroQual monitor).

### **Suspended Particulate Matter**

Suspended Particulate matter were determined using Met one instrument, Met One Aerocet 531 Mini volume portable Air sampler manufactured in USA, (ASTM D4096-91).

| Ambient Air quality:     | Series 300 and Z-    | Gas analyser automatically extracts           |  |

# 5.8 Noise Level

Noise levels at the different sampling points were measured with the aid of a pre-calibrated digital readout noise meter. The noise sensor of the meter was directed towards the source of noise and the average reading over a period of 5 minutes was measured in decibels (dB). An EXTECH INSTRUMENT (China), model 407730 Sound level meter with measuring range of 40 dB (A) – 130 dB (A), accuracy of  $\pm 1.5$  dB (A) was used for the monitoring.

# 5.9 Microclimatic Data Collection

Microclimatic Data was gathered using a calibrated hand held and battery powered high precision Kestrel 4500 pocket weather Tracker for wind speed, humidity, temperature and wind direction.

Climatic and meteorological data were obtained through field measurement of some of microclimatic conditions (including relative humidity, wind speed and direction, ambient air temperature), and the climatic and metrological conditions from secondary sources including the Nigerian Meteorological Agency and other online weather trackers. For the ambient microclimatic conditions field survey, an automatic mini weather weather station was set up in an open ground at various sampling station and allowed to run for a minimum of 30mins in order to establish a microclimatic baseline of that particular station. All precautions usually taken when setting up a weather station and during measurements were observed for the onsite

measurements. These include setting up the weather station away from obstacles like buildings and tall vegetation, using an instrument shelter to display all temperature sensitive instruments, orienting the instrument shelter so that the sun's radiation does not fall directly on the instrument during reading and setting up the weather station in an area representative of the study area's totality, as prescribed by the World Meteorological Organization (WMO) standard. The instruments and methods used for monitoring the microclimatic parameters are highlighted in Table 5.7.

Table 5.7: Instrumentation and Method of Observation for Climatic and meteorological parameters

|                   |                         | Record Availability |          |

# 5.10 Soil

Soil samples were collected from each of the stations with the aid of a Dutch Hand Auger, Hand gloves, a spool and hammer at depths of 0-15cm and 15-30 cm, representing top and subsurface samples from eight (10) locations (Plates 5.5 (a) and 5.6 (b). These depths correspond with the depths at which most (>80%) of the plants roots and soil micro-organisms are concentrated.

Plate 5.6 (a): Soil Sampling at a sampling location (near Turawa community) Plate 5.6 (b): Soil Sampling at a sampling location (near Karaye). Sampled points were geo-referenced on the field using the Garmain Global Positioning System (GPS) Equipment. The physic-chemical properties of the soil including appearances depth, texture, pH levels, hydrocarbons, microbial contents etc., were also examined, alongside the land use practices. All soil samples connected were analyzed in the laboratory using standard methods. The following sub-samples were taken at different depths (0-15m; 15-30m depth), namely;

- Samples for physico-chemical parameters which were put into polythene bags;
- Samples for hydrocarbon analysis which were put into glass bottles;
- Samples for microbiological analysis collected McCartney bottles and stored in icepacked coolers

# 5.11 Vegetation Studies

Vegetation studies were conducted at the same sampling locations as those for soil studies to determine the species composition, diversity and population of plant species. The density and percentage of the major tree species and the herbaceous layers were determined. In addition,

the rare and endangered plant species as well as plants of special significance to the ecosystem and the local economy were classified.

Plant species diversity determined as the ratio between the number of species and "importance value" which, for the purpose of this study, were taken as the number of individuals per quadrant (Odum, 1971). The vegetation studies were carried out using a combination of line transects and quadrant sampling techniques. At each sampling location, two quadrants measuring 10m x 10m and 1m x 1m were used to study trees and shrubs, and herbs respectively. The plant community structure was observed and the plant species within each quadrant were identified. The floral and vegetative parts of unidentified plant species were collected, pressed in the field with herbarium press, and taken to the laboratory for herbarium

### 5.12 Wildlife

Wildlife studies involved a census/count of mammals, birds' reptiles and amphibians sited around the project area. Direct count using a pair of binoculars for sighting was employed for the census of reptiles, birds and other animals that readily appeared during the investigation. The presence of some of the animals was ascertained by probing such habitants like logs, heaps of dead decaying leaves, vegetated areas, ponds and burrows etc. The wildlife sighted, were identified on the spot to ease with help of field guides. Survey of literature relevant to the project environment in (the ESIA Report for the Hadejia Jama'are Sub-Basin with Kano River Irrigation Scheme (KRIS) and Hadejia Valley Irrigation Scheme (HVIS) 2017; and (ESIA) for the Proposed 330/132/33kV Transmission Substation New Kano, Kano State, SMEC March, 2017) also provided opportunity to supplement information on wildlife existing in the area.

# 5.13 Aquatic Studies

# **Physico-chemical Characteristics**

Acquatic studies include study of Surface and Groundwater water in the project area. Samples were collected from 4 existing sources including the Challawa Reservoir, Gumshi river, Jerry River, and upstream of Challawa River. Ground water was collected from boreholes in the area.

A water sampler was used to collect water samples at designated locations. Samples for Total Hydrocarbon Content (THC) measurements were placed in 1 liter glass containers concentrated hydrochloric acid (HCI) added and sealed with aluminum foil. While the samples for the heavy metal analyses were placed in 150ml plastic container concentrated nitric acid (HNO<sub>3</sub>) added to

adjust the pH to 2. Biochemical oxygen demand (BOD) samples were collected in 250ml brown reagent bottles, sealed to exclude air bubble while the dissolved oxygen (DO) samples were fixed immediately with Winkler's I and II reagents. Unstable physiochemical parameters of water such as pH, DO, temperature, salinity, turbidity and conductivity were measured in-situ using pre-calibrated portable digital meters (Plate 5.7). All samples were preserved in a cool box and transported to the laboratory for analyses.

Plate 5.7: Surface water sampling

# Sediment Physical-chemical analysis

Sediment samples were collected by means of Eckman grab submerged into the water to collect sediment samples. The sediment study was to understand the history of waste load discharges of the aquatic environment over an extended period of time. Sediment (bottom of the surface water body) serves as a sink for contaminants from the overlying waters. The physical-chemical characteristics of the sediment are an indication of the pollution level and the type of

pollutants that has been in the overlying surface water. Several physical-chemical parameters for recovered sediment samples from the water bodies in the study area were conducted. Some of the parameters include the pH, total Hydrocarbon (THC), nitrates, phosphates, sulphates, magnesium, sodium, potassium, calcium and about 10 heavy metals.

### 5.14 Design of the Socioeconomic Survey

Several techniques and methods were adopted forb the socioeconomic baseline data collection. These include the use of interview schedules/questionnaire, Key Informant Interviews (KII) and Focus Group Discussion (FGD) as primary sources. In addition, and very importantly, as a primary technique of data gathering, community consultations. Visitations were also carried out on the existing social infrastructural facilities and services, e.g., education and health care infrastructure for necessary information on education and health. As a survey instrument and primary data gathering method, the questionnaire was structured such that binary, optional and open-ended questions were raised to solicit the necessary answers to questions from the community members who were on ground.

#### **Study Population**

The study population comprised of all the individuals making up the *de facto population* of the riparian communities within the Challawa Gorge Dam area. Sample Size Determination: Taro Yemani's (1997) criteria  $n=N/(1+N)(e)^2$  for Population of up to 250000 : Sample Size = 250. Administration of Research Instrument at 9 Village Areas was assisted by 5 enumerators; Key Informants Interview including the Operators of the Chgallawa Gorge Dam, officials of the HJKYB-TF and selected community leaders in the project area. Four FGD sessions was held with four community groups. Questionnaire administration was conducted at 10 Village Areas.

A random sampling technique was used in selecting respondents from the surveyed communities (Rogo, Turawa, Sakarma, Daura Gari, Yola, Gumsi, Dam Site, Jerry and Magaji Haji communities) for the communities' interactions (Key Informant Interviews) as well as during the cross session of respondents within the community with the adult population as the target.

# Socio-economic Data Analysis and Presentation

Various statistical techniques and tools were used in the report. The most common were summary percentages, ratios and averages. The data were presented mostly in tables and charts. Population sizes and relevant distributions were determined using the following formulae:

# a. Population projection using the exponential model

 $P_t = P_o (1 + r)^t$ ; where  $P_t$  is the estimated population at time ,t, (i.e current year population) and  $P_o$  represents the population at the base year. And 'r' is the population growth rate.

| b. | Sex Ratio = Number of males in the LGA X 100                                   |
|----|--|
|    | Number of females in the LGA   |
| C. | Dependency Ratio = Population $\leq$ 14years + population $\geq$ 65years X 100 |
|    | Population aged 15-64years   |
| d. | Crude Birth Rate (CBR) = Number of births in the community in one-year X 100   |
|    | Mid-year population  |
| e. | Crude Death Rate (CDR) =   |
|    | Number of deaths in the community in one-year X 100                            |
|    | Mid-year population  |

# Health-Impact

An integrated descriptive, cross-sectional study design was adopted for the community health survey. It involved community-based households and facility-based surveys. Quantitative data was complimented by qualitative information by way of key informant interviews of opinion leaders of the community to understand other socio-cultural and economic characteristics of the people that influenced their health statutes. Specifically, in depth interviews of the nurses in private and government medical centres were conducted.

# **Sampling Techniques**

The cluster sampling technique was adopted for the baseline survey. The technique has an advantage of being easier and faster to complete as the study populations occur in cluster and is often more acceptable to local communities. Four clusters were identified, out of which households were sampled using a random technique. In each cluster households were listed and the required number of households determined by a simple random method. This procedure was continued until a desired sample size was obtained.

In a household selected for the study, the heads of the household was interviewed by means of structured questionnaire and was physically examined. The examination consisted of blood pressure (BP) measurements, Ear, Nose and Throat (ENT) examinations, Hearing tests, Skin and Eye examinations. Children ages 0-59 months were measured for heights and weights mid-upper arm circumference.

#### 5.15 Land Use

Land use refers to the use of a given parcel of land is put into. On the other hand, the utilization of a parcel of land for any given purpose determines the use in which that land is put into. The land use types found in the proposed project environments were observed directly from the field and what is reported in literature (Abubakar *et al 2018*). Figure 5. provides an overview of land use in Kano region that hosts the Gorge Dam. Land use types of the sampled communities were collapsed into one i.e., within a given local government area, all the land use types were valued and put together and the average considered for analysis and discussion.

### 5.16 Quality Assurance/Quality Control

Standard field methods were used in the sample collection at the site as recommended by FEPA (1991). To ensure the integrity of some unstable physicochemical parameters *in-situ* measurements of temperature, pH, electrical conductivity (EC), dissolved oxygen (DO), turbidity, salinity and total dissolved solids (TDS) were carried out in the field using water quality checker Horiba U-10. To maintain analytical accuracy, duplicate and blank samples were included in the analyses. Distilled water used for analysis conforms to ASTM D 1193 Type 1. Only qualified and trained personnel were employed in the laboratory work.

### Sample Preservation and Storage

The water samples collected were stored in ice-packed coolers and preserved in accordance with Department of Petroleum Resources and Federal Ministry of Environment Guidelines and Standards. All water samples for heavy metals were preserved by the addition of concentrated HNO<sub>3</sub>, while to the samples for total hydrocarbon concentrated HCI was added.

### Laboratory (Analytical) Procedures

Laboratory analyses of the physicochemical parameters were carried out in keeping with standard practice specified in FMEnv Environmental Guidelines and Standards (FEPA 1991). Except otherwise stated, the laboratory methodologies for wastewater are from Standard Methods for the Examination of Water and Wastewater 19<sup>th</sup> Edition, 1998. Investigation involving the heavy metals concentrations was carried out using atomic spectrophotometer (AAS Unicam 969). Exchangeable cations and anions measured using flame photometer and UV/Visible spectrometer (Unicam Helios Gamma, UVG 073201; Spectronic 21D). Briefly, the methods employed are as follows:

### pH, Electrical conductivity, Turbidity, Dissolved solids, Temperature and Salinity

Measured using Horiba Water Checker (Model U-10) after calibrating the instrument with the standard Horiba solution. The units of measurement are  $\mu$ S/cm, NTU, mg/l, <sup>0</sup>C and ‰; respectively for conductivity, turbidity, temperature and salinity.

### Dissolved Oxygen (APHA-4500 C)

The dissolved oxygen (DO) was determined by the Modified Azide or Winkler's method (APHA 1998). To a 70ml BOD bottle filled with sample. 0.5ml manganous sulphate (Winkler I) solution and 0.5ml alkali-iodide-azide reagent (Winkler II) were added, stopper (excluding air bubbles) and mixed by several inversions. After about 10minutes, 0,5ml conc.  $H_2SO_4$  is added, re-stopper and mixed for complete dissolution of precipitate. The fixed sample is taken to the laboratory for further analysis.

### **Biochemical Oxygen Demand (APHA-5210-B)**

Known portion of the water sample collected is diluted with oxygenated and incubated at 20<sup>o</sup>C for five days. At the end of the incubation period the samples were treated in the same manner as the DO samples stated above. Detection limits 2.0mg/l.

### Total Alkalinity (API-RP 45)

Bicarbonate determination is by titration with 0.02N  $H_2SO_4$  using methyl orange indicator. The detection limit is 1.0mg/L as CaCO<sub>3</sub> (APHA, 1985).

### Chloride (APHA 4500 – Cl<sup>-</sup>B)

Chloride is titrimetrically determined by the Argentometric method in the presence of potassium chromate as indicator. Limit of detection is 1.0mg/l

# Sulfate (APHA 4500-SO<sub>4</sub><sup>2-</sup> E/AST MID 516)

Sulphate determination is by the turbidimetric method (APHA 1998). To a 50ml sample or portion diluted to 50-ml contained in a conical flask, 2.5-ml of conditioning reagent (i.e. a mixture of 50ml glycerol with a solution of 30ml concentrated hydrochloric acid, 300ml distilled water, 100ml 95% ethanol and 75g sodium chloride) and a quarter spatula full barium chloride (Bacl<sub>2</sub>). The mixture is swirled for a minute and the barium sulphate (BaSO<sub>4</sub>) turbidity read at fifth minute on Spectronic 21D at 420nm against water. Sulfate level was read from a calibration curve

prepared for known sulphate standards treated the same way as the samples. The detection limit is 1.0mg/l.

# Phosphate (APHA 4500-P E/ASTM D 515)

Phosphate is determined using the stannous chloride method (APHA, 1998). To 50ml sample, the following were added with mixing 2.0ml ammonium molybdate reagent and 0.2ml stannous chloride reagent. After 10 minutes but before 12 minutes from addition of stannous chloride, the absorption of the treated sample is read on Spectronic 21D at 690nm. Phosphate level is obtained by reading off absorption level from standards curve of known standards treated as the samples. The detection limit is 0.05mg/l.

### Nitrate

Nitrate measurement is by Ultraviolet Spectrophotometric screening method. To 50ml clear sample, 1ml HCl solution was added and mixed thoroughly. Absorbance measurements made at the wavelength of 220nm and the nitrate concentration obtained from the standard curve. Limit of detection is 0.05mg/l.

# Total Hydrocarbon Content (THC) ASTM D3921 (Extraction/Spectrophotometry)

A known volume of the sample was well agitated and poured into a separatory funnel. A known quantity of sodium chloride was added to prevent emulsification. 50ml of xylene was added to the sample container and then shaken properly to rinse the container before transferring into the separatory funnel. The funnel was corked and shaken vigorously for about 1 minute. The mixture was allowed to stand for separation. The sample portion was run-off by opening the tap and then the extract transferred into a 100ml centrifuge tube by passing it through a filter paper containing 1g of sodium sulphate. The extraction process was repeated with another 50ml of xylene. The xylene layer was then collected into same centrifuge tube containing the first extract.

The separatory funnel was rinsed with 10ml xylene before transferring into the centrifuge tube. The extract was centrifuge for 15mins at 1500 rpm and placed in a standard cuvette with a light path of 10mm. The spectrophotometer was standardized and sample readings taken. THC concentration was calculated with reference to the standard curve and multiplication by the appropriate dilution factor. Detection limit is 0.01mg/l.

# Heavy metals (Cr, Cu, Pb, Fe, Cd, Ni, Zn) APHA 3111-B (AAS)

Heavy metals were determined using an Atomic Absorption Spectrophotometer (AA) as described in APHA 3111B and ASTM D3651. This involved direct aspiration of the sample into an air/acetylene or nitrous oxide/acetylene flame generated by a hollow cathode lamp at a specific wavelength peculiar only to the metal programmed for analysis. For every metal investigated, standards and blanks were prepared and used for calibration before samples were aspirated. Concentrations at specific absorbance displayed on the data system monitor for printing. Limit of detection is <0.01mg/l.

### 5.17 Microbiology

# Methods of Sample Collection

a. Water samples were collected in accordance with the procedures described in standard methods for water and wastewater analysis (APHA, 1998). The same is accepted and adapted by FMEnv as standards for Nigeria. According to the procedure, 200ml of sterilized sample bottle was used for collecting water sample.

(b) The samples were preserved in an ice-cooled container and transported to the laboratory for analysis. All analysis was carried out at the Kano State Ministry of Environment Laboratory, Kano, Kano State.

# **Quality Control Measures**

i) Clean sterile containers were used for sample collection to avoid external contamination of the sample.

ii) Sample was transported in an ice packed cooler to the laboratory and analyzed within 2 hours of collection or stored in refrigerator for analysis at other days.

iii) Procedures for sample collection were done aseptically and in accordance with standard procedures.

# 5.18 Methods of Sample Analysis

# (a) Enumeration of Bacteria

Serial dilution procedure as described by Obire and Wemedo (1996); Ofunne (1999) was employed for cultivation and enumeration of bacteria and fungi in the water samples. The tenfold serial dilution was used to obtain appropriate dilutions of the samples. Aliquots of the required dilutions were plated in duplicates onto the surface of dried sterile nutrient agar (for total heterotrophic bacteria). In case of total/faecal coliform bacteria, the most probable number (MPN) technique described by Collins and Lyne, (1980) was employed for estimation of their numbers in water. Appropriate volumes of undiluted water samples were inoculated into test tubes of MacConkey broth medium. All inoculated media were incubated at 37<sup>o</sup>C for 24 hours or 3-7 days except for faecal coliform bacterial set up incubated at 44.5<sup>o</sup>C.

# (b) Media used for enumeration of microoganisms

(i) Nutrient agar medium used for enumeration of total heterotrophic bacteria prepared according to the manufacturer's specifications.

(ii) Mac Conkey broth medium for estimation of total faecal coliform bacteria in water.

### (c) Quality Control Measures

(i) Samples were analyzed in standard microbiological laboratory in accordance with standard procedures.

(ii) Procedures for cultivation and enumeration of bacteria were carried out aseptically to avoid contamination from external sources.

(iii) All media and glass wares used were sterilized in an autoclave at 121°C for 15 minutes.

### **Chain of Samples Custody Procedure**

There is a Master Register for all samples brought into the laboratory. Following registration of the sample, a Sample Data Sheet containing pertinent information on the sample was opened for each sample. The information includes:

- f) sample reference number;
- g) nature or type of sample;
- h) site of collection;
- i) date and time of collection; and
- j) Mode of preservation (depends on nature of material) and analytical data from the field.

Appropriate methods were used in storing the remaining stock materials and sub samples. Samples for storage were kept in labelled compartments on shelves in a storage room. Samples sent to co-operating laboratories were recorded in the Master Register and accompanied by essential data pertaining to the sample material.

# 5.19 Description of Baseline Biophysical Environment

### 5.19.1 Climate/Meteorology

### Climate

Climatic factors are the main determinants in the catchment hydrology, runoff formation and erosion process. This study relied on secondary climate data derived from literature survey and supplemented by field observations and measurement of other factors including air quality and noise. Additional climate data were collected from weathersparc.com (at

# https://weatherspark.com/y/58575/Average-Weather-in-Karaye-Nigeria-Year-Round) and

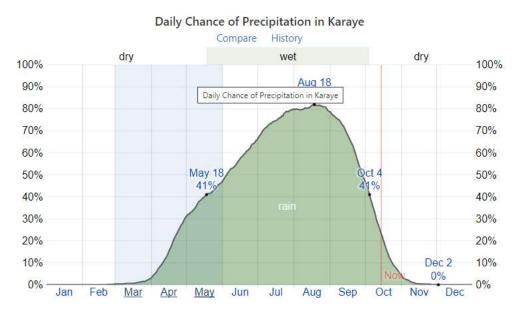

CLIMWAT and gridded climate data were also abstracted from available global data sources. Rainfall and temperature data for Karaye both dry and wet seasons (the location of the dam reservoir) were adopted from dataset provided by SMEC 2019 report.

# **Precipitation (PPT)**

A *wet day* is one with at least 0.04 *inches* of liquid or liquid-equivalent precipitation. The chance of wet days in Karaye varies very significantly throughout the year. The *wetter season* lasts 4.6 *months*, from *May 18* to *October 4*, with a greater than 41% chance of a given day being a wet day. The month with the most wet days in Karaye is *August*, with an average of 25.0 *days* with at least 0.04 *inches* of precipitation.

The *drier season* lasts 7.4 *months*, from *October 4* to *May 18*. The month with the fewest wet days in Karaye is *December*, with an average of *0.0 days* with at least *0.04 inches* of precipitation.

Among wet days, we distinguish between those that experience *rain alone*, *snow alone*, or a *mixture* of the two. The month with the most days of *rain alone* in Karaye is *August*, with an average of *25.0 days*. Based on this categorization, the most common form of precipitation throughout the year is *rain alone*, with a peak probability of *82%* on *August*.

Figure

### **Cloud Cover:**

In Karaye, the average percentage of the sky covered by clouds experiences significant seasonal variation over the course of the year. The clearer part of the year begins around November and lasts for about 4 months, ending around March. The clearest month of the year around the project area is January, during which on average the sky is clear, mostly clear, or partly cloudy 64% of the time. The cloudier part of the year begins around March and lasts for 8 months, ending around November, while the cloudiest month of the year in Karaye is May, during which on average the sky is overcast or mostly cloudy 74% of the time and signals the commencement of the rainy season (Figure 5).

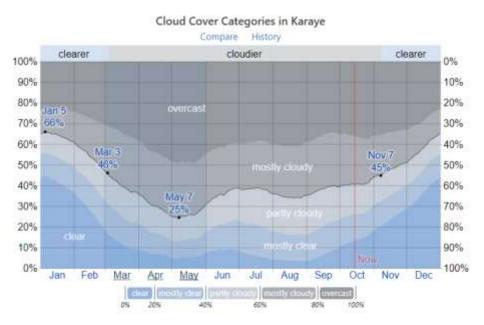

Figure 5.12: Cloud Cover Categories in Karaye

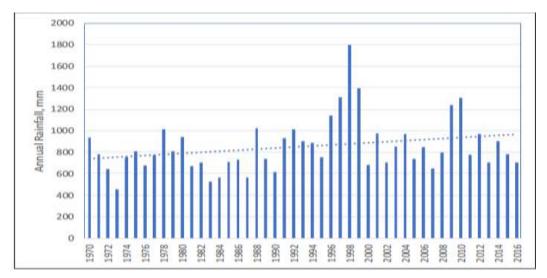

Source: https://weatherspark.com/y/58575/Average-Weather-in-Karaye-Nigeria-Year-Round

# Rainfall

The climate of the project area is dominated by rains from June to September. The seasonal rainfall is characterized by a single wet season from June to September displaying a monomodal pattern whereby monthly rainfall varies from 113 mm in June, 262 mm in August declining through to 153 mm in September. On average 85 % of the annual total rainfall falls during the wet season.

The annual rainfall for the period 1970 to 2016 varies from a minimum of 453 mm recorded in 1973 to a maximum of 1,799 mm in 1998. A slightly increasing trend in annual rainfall prevails in the region as the data in fig. 5.2 reveals. Drought occurred for four years out of 47 years which is on average once every 12 years.

The climate of the project area is dominated by rains from June to September. However, the annual rainfall is less than the mean in 27 years out of the 48 years and occurred consecutively showing the persistence of drought. The deviation of the annual rainfall from the annual mean are plotted in Figure 5.12 and fig. 5.14 and show that in the 1970s and 1980s drought was persistent. However, in the 1990s normal rainfall years were observed. In recent years droughts occur less frequently, where drought year is followed by normal year.

**Figure 5.13 Annual Rainfall Data at Karaye Grid point** Source: SMEC SAP Report 2019

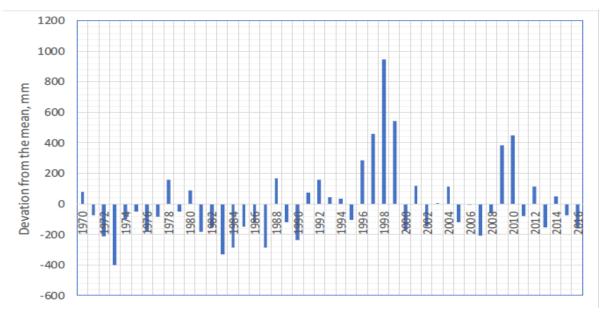

Figure 5.14: Deviation plot of annual rainfall from the annual mean (Karaye grid point) Source: SMEC SAP Report 2019

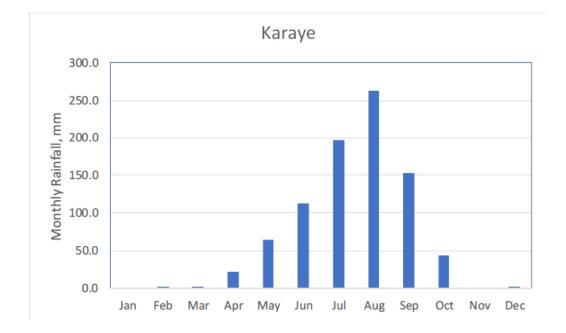

Figure 5.15 Long Term Average (LTA) Monthly rainfall at Karaye Grid point (Source: SMEC SAP Report 2019)

The mean LTA monthly rainfall in the area that usually comes around July and August can be as high as 330 mm while there can be months with no rain at all especially around November to March.

### Temperature

Kareye, the headquarters of Karaye Local Government that hosts the Challawa Gorge Dam has climatic conditions similar to what obtains in the North Central part of Nigeria. The LGA is located some 120km south of Kano city and boarders Rogo, Kiru and Getso Local government Areas. The area experiences the usual wet and dry climate. The wet season is oppressive and mostly cloudy, the dry season can be partly cloudy, and it is hot year round. Over the course of the year, the mean annual temperature varies from 12<sup>o</sup>C to 37.3°C.

The project area experiences relatively high temperatures for most of the year from January to December. The hot season lasts for about 2.0 months, usually March to May, with an average daily high temperature of above 36°C. The hottest month of the year in Karaye is April, with an average high of 37.2°C. The cool season lasts for 1.9 months, from November 30 to January 27, with an average daily high temperature below 31.1°C. The coldest month of the year in Karaye is January, with an average low of 12.8°C and high of 31°C.

Daily high temperatures increase from 31.1°C to 34.4°C. Fig. 5.5 shows the daily average high (red line) and low (blue line) temperature, with 25th to 75th and 10th to 90th percentile bands. The thin dotted lines are the corresponding average perceived temperatures. Figure 5.16 shows a compact characterization of the hourly average temperatures for all the months January to December. The horizontal axis is the day of the year, the vertical axis is the hour of the day, and the color is the average temperature for that hour and day. The average hourly temperature, color coded into bands. The shaded overlays indicate night and civil twilight.

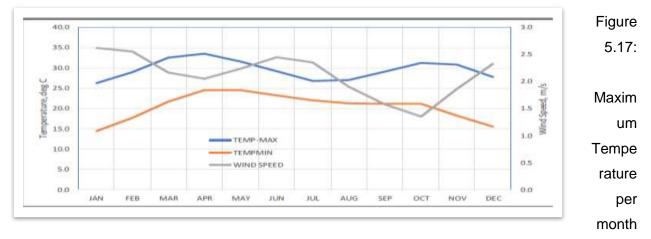

#### Figure 5.16: Average high and low temperatures in Karaye

(Sourcehttps://weatherspark.com/y/58575/Average-Weather-in-Karaye-Nigeria-Year-Round)

Linked is to Harmattan, from December to February, which marks the main dry season in the area, both low maximum and low minimum monthly temperatures are observed. From March to April average temperatures reach a maximum because of high day maxima and limited night cold (thus very low diurnal temperature range), while wind speed is also at a maximum. In July/August, the daily variation of temperature is low and wind speed is low. Kano region is typically very hot throughout the year, though from December through February, ambient temperature is noticeably cooler. Nighttime temperatures are cool during the months of December, January and February, with average low temperatures of 11°-14 °C. Historically the recorded temperature averages 26.1°C. (Fig. 5.17)

For the Challawa sub-basin area, monthly and long-term average temperatures reach highest levels from March through to June, with lows in January when the Harmattan weather persists throughout the dry season. A maximum monthly temperature of 33.5 °C occurs in the middle of the dry season in April with a low of 14.5°C in January at the height of the Harmattan season. Monthly average maximum temperatures vary from 26.3°C in January to 33.5°C in April. Wind speed varies from 1.73 – 2.95 m/s and averages 2.35 m/s with high wind speeds from November through to a peak in February. Sunshine hours vary from just 11.26 hours in January to 12.6 hours in June

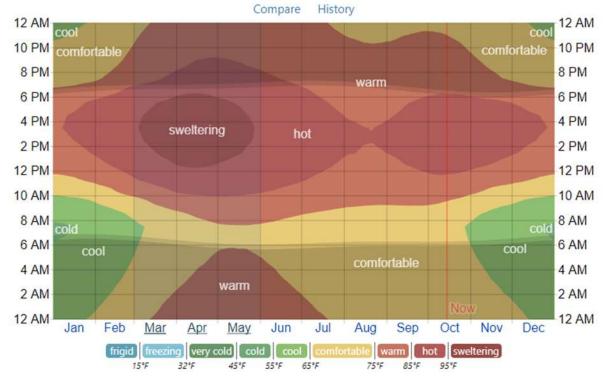

(Average over 1981 - 2010)

(Source: SMEC (2015) ESIA Report for the New Kano 330KVA Power line.

Figure 5.18: LTA maximum temperature, minimum temperature and wind speedSource: SMEC SAP Report 2019

Figure 5.19 shows a compact characterization of the hourly average temperatures for all the months January to December. The figure shows cool and comfortable morning hours 12am until about 11 am daily for most of the year except the period from middle of March to Middle of July which corresponds with the vernal equinox usually from March 20 -21 until June 23.

### Wind Speed and Direction

When the ITCZ is to the south of the equator, the prevailing north-easterly winds dominate the region bringing with it the dry-season condition which lasts from November to March each year. From late March to late September the south westerly winds prevails bring rainfall and thunder storms marking the rainy (wet) season. At the time of field investigation conducted in July-August wind direction was generally in the Field measurements made on site, the prevailing wind was south westerly, with wind speeds of 0.8 - 1.6 m/s.

### **Relative Humidity**

The Saharan air causes the dry season which is accompanied by low relative humidity and intense aridity that makes the atmosphere very dusty while the rainy season follows the advancing Atlantic Maritime Air accompanied by high humidity in the rainy season. Relative humidity measured on site ranged from 62.0 – 87.0 %. This is not surprising as the measurements were made on separate days in the middle of August. By November tp late February relative humidity could go below 20% due to desiccating effect of the dry Harmattan winds that blows over the region from the Sahara desert. The low humidity periods therefore correspond with the low or no rainfall period in the region (fig.5.21). The implication for people's livelihood activities is that agricultural activity which is the dominant livelihood support for over 80% of the rural communities is at its lowest leaving only a small percentage of farmers engaging in irrigation farming especially near rivers and the Fadama plains where the ground water level is high enough to support irrigation. The Challawa Gorge Dam reservoir therefore also provides good irrigation opportunities for the local communities at this time of water scarcity for agriculture.

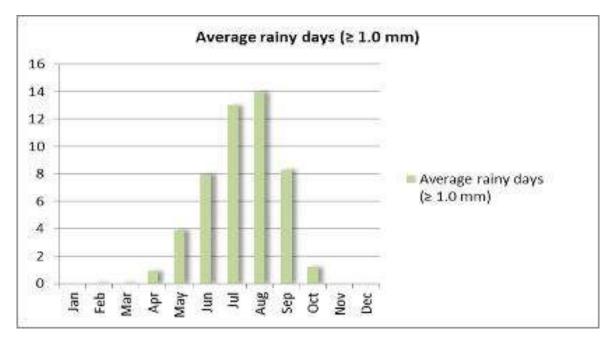

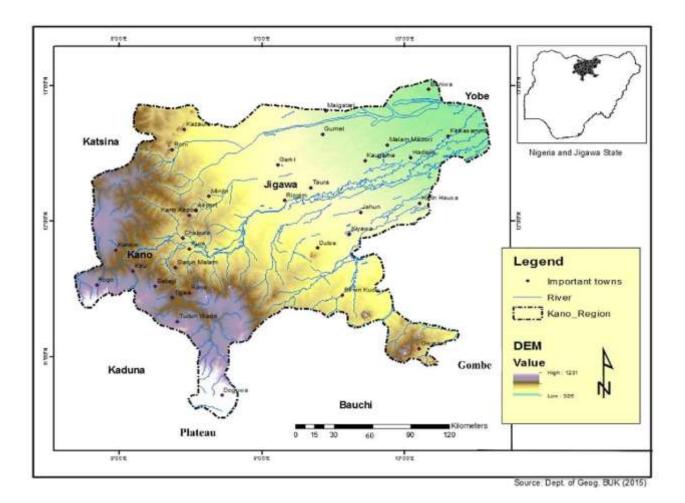

Figure 5.21. Average Rainy Days (≥ 1.0mm (1981 –2010)

### 5.20 Relief and Drainage

### **Drainage Pattern**

Three main rivers of the entire HJKY basin are the Hadejia and Jama'are rivers that meet in the Hadejia-Nguru wetlands to become the Yobe River, and the Komadugu-Gana River which meets with the Yobe River near Damasak (Fig. 5.22 The river then flows eastward, ending in Lake Chad. Historically the Yobe River contributed only 1% of the total inflow into the Lake Chad (Mott MacDonald, 1993). The Hadejia River splits into three channels in the Hadejia-Nguru Wetlands (see Figure 2.23); the old Hadejia River which subsequently joins up with Jama'are River, the Marma channel which flows into non-returning Nguru Lake and the relatively small Burum Gana River which re-joins the old Hadejia River further downstream. The Hadejia River system is more than 70% controlled by Tiga Dam (in operation since 1974) on the Kano River and Challawa Gorge Dam (in operation since 1992) on the Challawa River. The Jama'are River System is presently uncontrolled, but plans exist since over 30 years ago to build a dam at Kafin-Zaki. Construction started two times but has since stopped due to conflicts from downstream users.

Both river systems are gaining flows down to the geological division between the Basement Complex rocks and the Chad Formation. Downstream of this divide the rivers begin to infiltrate into the permeable sediments. In the nearly flat middle and lower parts of the Basin, the rivers spill into the flood plains during the wet season (June to October). The land surface area of the KYB within Nigeria is around 116,293km<sup>2</sup> and contributes only 2.5% of the total runoff to Lake Chad.

# Ambient Air Quality for Wet season

The Federal government of Nigeria established the Federal Environmental Protection Agency (FEPA) in 1988 to protect, restore and preserve the ecosystem of Nigeria. To improve the quality of the environment and prevent the occurrence of pollution related environment hazards, the FEPA established environmental guidelines and standards for the abetment and control of all forms of pollution. This involved the setting up of the Nigerian Ambient Air Quality standards (NAAQS) to protect public health and the environment. The ambient air quality index is shown in Table 5.9.

Table 5.9: The ambient air quality index is shown

| Good   | Moderate | Unhealthy<br>sensitive groups | for | Unhealthy | Very unhealthy | Hazardous |
|--------|----------|-------------------------------|-----|-----------|----------------|-----------|
| 1 - 50 | 51 - 100 | 101 - 150                     |     | 151 - 200 | 201 - 300      | 301 - 500 |

It is against this background that the quality of air around the Challawa Gorge Dam Watershed was monitored to ensure its quality and to for the planned watershed management activity falls within the approved acceptable environmental limits of air and noise quality of the project environment.

The air quality monitoring for this ESIA for the rainy season was done in two phases. Over a period of 5 minutes at each of the sampling locations, *in-situ* air quality monitoring was carried with pre-calibrated portable ambient air quality meters to measure the following parameters: Sulphur (IV) Oxide (SO2), Nitrogen (IV) Oxide (NO2), Carbon Monoxide (CO), Volatile Organic Compounds (VOC), and Particulate Matters(pm). The gaseous pollutants measured are

summarized in Table 5.10. Result of air quality analysis showed that none of measured pollutants was found to be significant at all sampling locations. The measured levels of Suspended Particulate Matter (SPM) were within the regulatory standards. Therefore, it is safe to conclude that the background air quality in the project area is generally good.

# Air Quality (Dry Season)

Dry season information on air quality was based on a proxy data from an ESIA on a project located close to the Challawa Watershed Management Project (Century Mining Limited, Tin and Zink Mining, kano State. Proxy data was used because this ESIA is mainly a wet season report as per terms of the Study. The result of air pollution measured during the dry season is shown in Table 5.11. The results indicate that all pollutants measured were within regulatory limits of FMEnv indicating that the air quality of the area is excellent. Noise level ranged from 36.8dB (A) – 56.2dB (A). The highest noise value was recorded during vehicular movement. The values were below the regulatory levels for noise values which is 70dB (A) for industries and 50-60 residential and small-scale industries areas, over a period of 8 working hours.

# **Ambient Noise Level Assessment**

Ambient Noise levels at different points were measured using sound level meter with a detection range of 40dBA to 130dBA. Noise level measurements were taken at a height of approximately 2m above ground level and the response time was set to slow and read on the 'A' frequency weighting scale in unit decibels. The result shows that the is generally within the acceptable limits prescribed by NESRIA (Table 5.12).

The results of the ambient noise levels assessment during field work are as shown in Table 5.12. Higher noise levels were recorded noise in three different locations during the sampling: viz. 56.5dB(A), 61.0dB(A) and 62.3dB(A) which were higher than the NESREA Limits for residential area (55dBA). These high noise levels are as associated with vehicular movements. The NESREA Limits are in Continuous Equivalent Sound Level "Leq". This is a geometric average of the noise levels over the period of monitoring. This allows occasional peaks above the standard noise level which are compensated by occasional dips below the standard. Infrequent vehicle movements are typical examples which do not infringe on noise standard. Most of the noise levels are within acceptable levels. In general, the measured noise levels are representative of a typical rural environment.

 Ambient Noise Level Measurements (Wet Season)

### 5.22 Geological, Hydrology and Geomorphic Characteristics

#### 5.22.1 Geology of the Project Location

The literature survey suggests that the project area in fig. 4.2 is geologically characterized by mainly impermeable basement complex rock formations. Bawden, *et al.* (1973) described the region as being part of the northern plains which is largely characterized by extensive very gently undulating plains sloping gradually from over 600 meters above sea level south and west of Kano and to over 1,000masl north of Jos to less than 300masl towards the Lake Chad. The river systems in the area provide extensive flood plains that are used for livelihoods.

Pre-Cambrian rock of the basement complex which comprises of gneisses, amphibolite, marbles and the older granites which underlie large parts of Nigeria including the Kano Region (Adamu *et al*, 2014). The Granites are generally Gneissic and commonly developed in a mixture of Pegmatite of schist granite, Gneiss and irregular mass of pegmatite. The Aeolian sand derived from wind deposits cover most part of the area with thickness of about 5 meters in the upland and 10 meters along the lowland plains (Olofin, 1987). The geological structure influences the relief as well as landforms which are relatively flat, with some undulation especially around upstream of the drainage system of the area. The relief of the area has been categorized into four types comprising south and south eastern highlands; the middle and western high plains; the central lowlands and the Chad plain. The highlands occupy more than 50% of the surface area of the region and lies on an elevation ranging between 450 to 650masl. The high plains consist of areas of low relief, usually less than 20masl and areas of grouped hills where the hill may rise higher than 100m above the plains. The plains are developed on rocks of the Basement Complex.

The Hadeja Jamaare Basin is geologically underlain by Basement Complex upstream and the Chad Formation to the middle and downstream. While the upstream part of the basin is characterized by mainly impermeable Basement Complex rocks covered by the permeable quaternary sediments which consist of fine to coarse grained sand, with intercalation of sandy clay, clay and diatomite, the dunes in the middle part of the basin and alluvial deposits along the river systems are superficial deposits lying on the Chad Formation. The river alluvium deposits consist of sands, silts and clays with occasional existence of coarse sands and gravel along younger river channels.

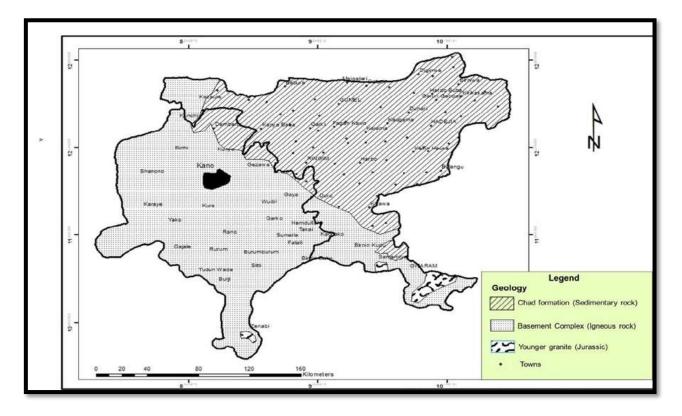

Figure 5.23: Geology of Kano State

# 5.22.2 Hydrology of the project location

Nigeria has extensive surface water resources, including the perennial Niger and Benue rivers and their tributaries. Groundwater is widely used for domestic, agricultural and industrial supplies. Most rural areas are dependent on groundwater, and a number of towns and cities.

# 5.22.3 Surface Water Occurrence

Surface water in the area occurs in rivers and streams, with River as Challawa the only perennial river (Garba, 2009). All others are either intermediate or ephemerals in nature. Surface water also exists in impounding reservoirs of four earth fill dams (colloquially called dams) constructed on these rivers. These are Challawa Gorge Dam constructed on River Challawa in 1992, Guzu-Guzu dam constructed on River Guzu-Guzu, Magaga dam on River Magaga and Kusalla dam on River Kurma at Karaye town.

The Komadugu-Yobe Basin is the primary source of water for domestic water, industrial and agricultural development within the 6 riparian states and Lake Chad. SMEC, 2019 estimated the outflows from each of the main sub-basins using available hydrological data (Fig. 5.24). The estimates show that the two largest sub-basins i.e. Hadejia and Komadugu-Gana, have very low "annual runoff coefficients" being about 7 % and 3 %, respectively. These figures are exceptionally low and are due to small annual rainfall and high potential evapotranspiration rates in the Basin; and the losses due to large wetlands and groundwater recharge in the sub-basins (Fig. 5.25).

The area lies within the Hausa plains and highest elevation is in the area is about 564masl above sea level, and a minimum elevation of 488masl down south of the area and with an average height of 526masl. Drainage in the area is largely influenced by the relief; lowland areas have the Rivers and streams. River Challawa is the only big River with tributaries, Magaga, Takwami, Gunshi, Jerry, Guzu- Guzu, Kutumbule, Iyaka, and the likes. The rivers are now mostly dammed. The area has a drainage density of 1.46Km/Km2 as calculated by the author. The general pattern of drainage in the area is dendritic mostly running in the north south direction (Garba, 2009).

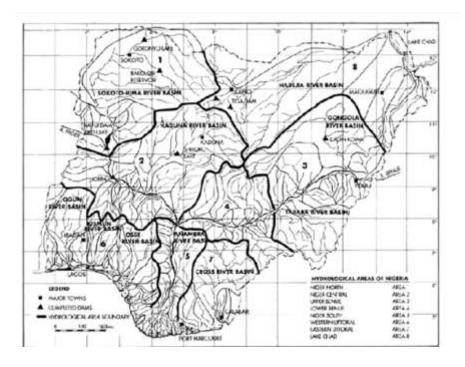

Figure 5.24: Map of Nigeria showing the Hydrological areas and Drainage network.

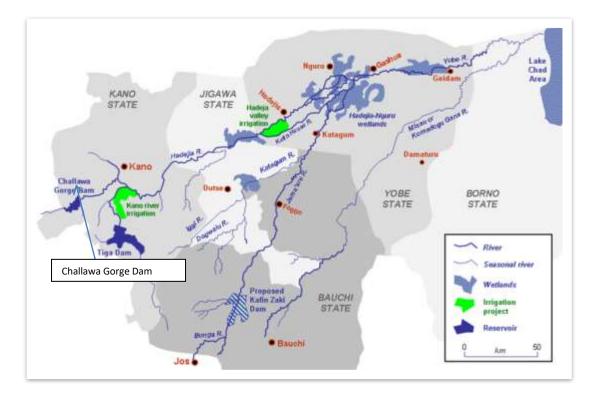

Figure 5.25: Hydrological Map of Hadeja-Jamaare-Komadugu- Yobe Basin, showing challawa Sub-Basin

# 5.22.4 Groundwater Availability and Uses

Groundwater availability varies in the region. Various factors affect its availability. The most recognized and important one is the geological differences. In their study Abubakar et, al (2018) revealed that, the volume of groundwater decreases from the Chad Formation to the Basement Complex region, with Birniwa area in the Chad formation region and Zarewa in the Basement Complex region where this project area lies, having volumes of 9.363.0m<sup>3</sup> and 49.0m<sup>3</sup> of groundwater respectively. Thus, groundwater availability is much higher in the Chad Formation than in the Basement Complex.

The Chad Formation in the Kano region is one of the largest accessible stores of fresh groundwater, and for that groundwater is often considered a logical resource in the region. Conversely, in the Basement Complex region, rapid rising population growth in association with urbanization and climate change have led to intensive exploitation of groundwater through construction of boreholes, principally for domestic water supply. Groundwater in the urban Kano area for instance appears to be a common and low-cost alternative to surface water for many uses because it occurs generally in a more potable quality compared to surface water.

However, despite the growing dependency upon groundwater for different uses in the Kano region, concerns remain over the sustainability of this resource principally in terms not only of the rate of abstraction but also in terms of the quality and quantity because the area is underlain by igneous structure.

Groundwater utilization in the study area varied from commercial, domestic and agricultural uses. In most parts of the study area, appeared to be the only alternative and reliable source of water for various agricultural activities, especially, the floodplain (fadama) irrigation agriculture. While rain-fed agriculture lasts for about three to four months in the area, floodplain irrigation is well practiced throughout the dry season lasting for six to nine months. Thus, groundwater from fadama aquifer is extracted by tube wells and wash bores to support irrigation in the dry season from the end of the rainy season, which provides opportunities in terms of agricultural diversification than in the southern region and enables for double or triple cultivation in one single year. In the southern part of the region, however, groundwater becomes virtually the most reliable source of fresh water for domestic and commercial activities. Increase in the level of demand and consumption of water leads to the drilling of boreholes by individuals, government and private companies. Consequently, thousands of commercial water companies have emerged increasingly particularly in the urban areas of the region to exploit principally groundwater as the main source of potable water. The reliance of groundwater in the study area is also partly due to the siltation at of the Kano Water Treatment plant at Panshekara ear Kano, which not only increased the cost of water treatment and reticulation but also labour demand on the part of the workers of the Water Works who are responsible for treating and managing the scheme.

The findings of Ayoade (1988) on groundwater availability in the region, revealed that the mean groundwater recharge contributed by river flow and rainfall accounted for 33% and 13%, respectively. The study further revealed, that groundwater beneath the floodplains dropped from 9000 MCM in 1964 to 5000 MCM in 1987 (a drop of about one half of its initial value). In the same development, the finding of Tanko, (2014) on the variation of groundwater levels in the same region of Kano revealed a positive relationship between rainfall and groundwater level variation. Thus, the study revealed a steady annual decrease of groundwater level from 2010 to 2013 in the area (Figure 5.26).

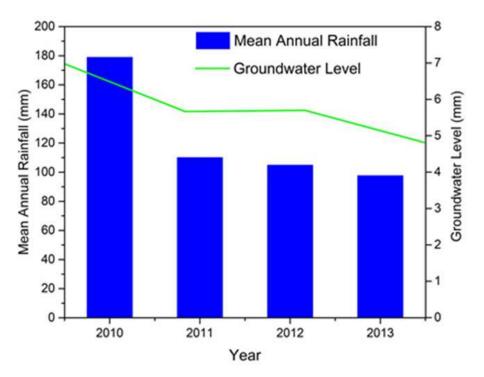

Figure 5.26: Annual trend of rainfall and groundwater level in the Hadeja-Jamaare Basin Area.

### 5.23 Soils

Reference to the 1:650,000 "Generalized Soil Map of Nigeria" shows eight soil types according to the FAO soil classification, including Cambisols, Regosols, Luvisols, Fluvisols Vertisols, Acrisols, Latosols and Nitisols were identified, with Luvisols having a major occurrence in the basin. In particular however, the soils of Challawa Gorge Dam sub-watershed reflect the general soil condition in Kano Region.

Soil was investigated through visual observation and sampling using variations in ecological features such as topography, geomorphology, hydrological characteristics, and land use patterns. Four composite soil samples were obtained from each of the 10 sampling stations Hand auger of uniform cross section was used to ensure that uncontaminated reproducible units of soil samples were collected from depths of 0-15cm (topsoil) and 15-30cm (subsoil). This ensured high quality representative data collection. Surface litter of un-composed plant materials were removed to ensure that uncontaminated soil samples were collected.

Sediment samples were also obtained from all surface water sampling points. Sediment sampling was carried out using the Eckman Grab sediment sampler. Several grab bites were done to collect enough samples for the different analyses. All the samples were collected in plastic bags and stored in ice-packed boxes at 4°C and subsequently transferred into refrigerators in the laboratory. Sediment samples for microbial analysis were collected in well-labeled aluminum foil plates and preserved in an ice-packed cooler at 4°C for transmission to the laboratory. Generally literature suggests that matured soils occupy the plains and the immature ones are found on hill slopes, foot slopes and valley-bottoms. The influence of topography and wind-drift materials from the desert is what shapes the aggregate of the soil structure in the region, although, the matured soils are of ferruginous type (Olofin, 1987). Adamu et al (2010) reported the soil type in the region as generally Sandy Loam (Table 5.7). A total of four (10) representative sediment samples were collected for laboratory analyses of the various soil parameters (Table 5.13).

| Sample Site |       | Sand % | Silt % | Clay % Soil Type |
|-------------|-------|--------|--------|------------------|
| S1          | 80.7  | 14.0   | 5.3    | Sandy Soil       |
| S2          | 57.7  | 32.3   | 10.1   | Ligh t Loam      |
| S3          | 80.7  | 14.3   | 5.3    | Sandy Soil       |
| S4          | 4.3 1 | 4.0    | 80.5   | Clayey Soil      |
| S5          | 80.7  | 10.2   | 5.3    | Sandy Soil       |
| S6          | 57.6  | 14.0   | 10.1   | Light Loam       |
| S7          | 57.6  | 32.3   | 10.1   | Sandy Soil       |
| S8          | 80.7  | 32.3   | 5.3    | Loamy Sand       |
| S9          | 79.5  | 14.0   | 5.1    | Loamy Sand       |
| S10         | 79.5  | 15.4   | 5.1    | Loamy Sand       |
| S11         | 57.6  | 15.4   | 10.1   | Light Loam       |
| S12         | 80.7  | 32.3   | 5.3    | Sandy Soil       |

#### 5.23.1 Physicochemical Properties of the Soils

#### Methodology

Ten (10) units were sampled for soil sample collection and analysis. The sampling units were the same for all samples collected for this ESIA study. Stainless steel, handheld Dutch type Soil Auger was used to collect soil samples at each soil sampling station (Plate 5.6). At each sampling station, soil depth 0-15 cm and 15-30 cm for topsoil and subsoil levels were collected. The method of soil analysis for all parameters is as presented in table 5.4.

Plate 5.8: Soil Sample Collection at a location at the project environment

# 5.23.2 Results of Soil Analysis

A Summary of the results of soil analyses including physical and chemical properties are presented in table 5.16. The detail result of analysis are attached as **Appendix 5.** The detailed analysis with respect to the physic-chemical properties is also presented below:

| S/N | PARAMETERS  | SUMMARY OF   | REMARKS      |
|-----|---|--------------|--------------|
|     |   | RESULTS      |              |
| 1   | Temperature (°C)                                  | 30.5         | Satisfactory |
| 2   | PH  | 7.13         | Satisfactory |
| 3   | Potential difference (MV)                         | 58.23        | Satisfactory |
| 4   | TDS( mg/kg)                                       | -            | Satisfactory |
| 5   | Conductivity us/cm                                | 142          | Satisfactory |
| 6   | Colour (PtC <sub>o</sub> U)                       | Redish brown | Satisfactory |

| 47 | Moisture Content (%)                | 0.31         | Satisfactory    |

### Soil pH

Soil reaction (pH) is a measure of acidity/alkalinity of the soil in terms of the free H+ ion concentration of soil solution. It influences the availability of certain elements in the soil. As shown in table 5.7, top soil had a pH ranging of 7.13 to 8.4 with an average value of 7.83. The bottom soil was found to have pH values ranging from 7.15 to 8.31 with a mean value of 7.68. Soils can be classified according to their pH value. A pH value of 6.5 to 7.5 is considered neutral, over 7.5 is alkaline and less than 6. Is acidic, and soils with pH less than 5.5 are considered strongly acidic. In the case of the project site the mean pH values for both top and bottom soils fall in the range of 7.68 to 7.83 and can be described as Alkaline.

# **Electrical Conductivity**

The electrical conductivity of a soil expresses the soil's total ionic strength, both cations and anions. Low total ionic strength of soil solution indicates low dissolved salts, and vice – versa.

The electrical conductivity of the topsoil of the project area ranged from 125 to 321 with an average conductivity of 158.9 while that of bottom soil ranged from 121 to 321 with average of 168.1. This is a measure of one of the macro plant nutrients in the soil that influences plant growth more than most plant nutrients, and it is the most important element in plant growth.

Soils were also collected from the study area and analyzed for heavy metals to determine their concentration. Low levels of many heavy metals are naturally present in most soils. Vanadium, Lead, Cadmium, Arsenic, and Mercury were not detected both in top and bottom soil samples. Oil and Grease content from samples collected from along the project axis were below the detection limit of the analytical equipment in top and surface soils.

Soil is of vital for the survival and welfare of the people especially rural communities whose livelihood depends more on quality and agricultural productivity of the soils. Thus any change in soil quality may have telling effects on livelihood sustainability in the rural areas. This is therefore highly significant for the project environment. Moreover, the project involves planting of exotic economic trees and grasses to stabilize soil, increase the surface cover, reduce soil erosion and by extension reduce load density of the rivers and the Challawa Reservoir. These changes degrade soil quality and alter physical and chemical parameters. Assessing the physicochemical properties of the soil of the project environment is therefore not only desirable, but also necessary.

**Total Organic Carbon (TOC %):** The soils exhibited wide variability in terms of total organic carbon content. In the top soil, TOC ranged from 0.2% to 1.3%, with a mean value of 0.75% and the sub soil percentage TOC ranged from 0.1 to 1.3%. The production, accumulation and degradation of organic matter are greatly dependent on climate. Temperature, soil moisture and topography are the major factors affecting the accumulation of organic matter in soils.

Organic matter tends to accumulate under wet or cold conditions where decomposer activity is impeded by low temperature (Buol, 1990) or excess moisture which results in anaerobic conditions (Trofimov et al 2008). Conversely, excessive rain and high temperatures of tropical climates as in the present assessment enables rapid decomposition of organic matter and leaching of plant nutrients. Excessive slope may encourage the erosion of the top layer of soil which holds most of the raw organic material that would otherwise eventually become humus.

In view of the observations during the field studies, the present variability in total organic carbon content of the soils could be attributed to its high accumulation around the densely vegetated and unhampered secondary forest portion of the area. The other areas possess less dense vegetation cover leading to reduced rate of plant residue returns and accumulation with inherent high decomposition rate on the sandy, loamy sand texture soil.

**Total Nitrogen:** Total nitrogen content varied between 10.1% and 18.6% with a mean value of 14.35%, while the subsoil total nitrogen content ranged from 10.2% to 18.9%. The total nitrogen content of soil depends on the climate, vegetation, topography, age and soil management. Usually, more nitrogen is under grassland than under forest. Humans formation promotes nitrogen immobilization.

Cultivation decreases soil nitrogen by exposing soil to more air which bacteria can use and notillage maintains more nitrogen than tillage. In the present study, the reasons given for the trend in the observed in the total organic carbon content in the soils is also applicable to the total nitrogen content in the soils.

**Cation: Sodium, Calcium, Potassium and Magnesium:** In the top soil, the mean levels of these cations in dry were generally low as follows; Sodium (82.5mg/kg); Calcium (1.52mg/kg), Potassium (1.56mg/kg) and Magnesium (2.535mg/kg) respectively while in the subsoil, Sodium (80mg/kg); Calcium (1.52mg/kg), Potassium (1.53mg/kg) and Magnesium (2.09mg/kg) respectively.

Anions: Sulphate, Phosphate, Nitrate and Nitrite: In the top soil, the mean levels of these anions in were as follows; Sulphate (38mg/kg); Phosphate (52.5mg/kg), Nitrate (13.8mg/kg) and Nitrite (0.66mg/kg) respectively while in the subsoil, Sulphate (38mg/kg); Phosphate (55.5mg/kg), Nitrate (14.54mg/kg) and Nitrite (0.72mg/kg) respectively.

### Organics (mg/kg)

Oil and Grease values were below detection limit for both top and sub. Polynuclear Aromatic Hydrocarbon values ranged from 1 to 1.6mg/kg for top soil while it ranged from 1.2 to 1.3mg/kg. Total Petroleum Hydrocarbon Content on the other hand, ranged from 0.18 to 0.45mg/kg for top soil and ranged from 0.16 to 0.31mg/kg for sub soil.

**Heavy metals:** In the top soil, the mean concentration of the heavy metals n and related soil micronutrient elements were as follows; Iron (4.8mg/kg), Zinc(6.45mg/kg), Lead (0.01mg/kg), Copper (1.4mg/kg), Cadmium(0.015mg/kg), Nickel(1.18mg/kg), Barium(0.7mg/kg). In the sub soil, the mean concentration of the heavy metals and related soil micronutrient elements were as follows; Iron (5.0mgmg/kg), Zinc(7.35mg/kg), Lead (0.015mg/kg), Copper (1.55mg/kg), Cadmium(0.025mg/kg), Nickel (1.085mg/kg), Barium(0.7mg/kg). For both top and sub soils, Manganese, Arsenic and Mercury values were below detection limit.

### Soil Texture:

Texturally the result of the physical analysis shows that the general soil type is Sandy Loam. This result is corroborated by the findings of Adamu *et al* (2010) earlier reported in table 5.7.

### 5.24 Sediment Physical-chemical analysis

Sediment samples were collected by means of Eckman grab submerged into the water to collect sediment samples. The sediment study was to understand the history of waste load discharges of the aquatic environment over an extended period of time. Sediment (bottom of the surface water body) serves as a sink for contaminants from the overlying waters. The physical-chemical characteristics of the sediment are an indication of the pollution level and the type of pollutants that has been in the overlying surface water. Several physical-chemical parameters for recovered sediment samples from the water bodies in the study area were conducted. Some of the parameters include the pH, total Hydrocarbon (THC), nitrates, phosphates, sulphates, magnesium, sodium, potassium, calcium and about 10 heavy metals. The result of sediments analysis is presented in table 5.15. The laboratory result was compared with the Limits set by the Federal Ministry of Environment. The exampling points were found to be same as that of the surface water.

# 5.25 Groundwater and Surface Water Quality

# Groundwater Availability

Ground water is a major source of water in the Challawa sub-basin of the Hadeja Jamare Komadugu Yobe Basin. In some areas, especially in the study area, it is the leading source of water for domestic and other non-domestic uses. It is a basic resource that is for livelihood sustainance. High groundwater use occurs in the eastern part of the Basin by exploitation of the shallow unconfined and deep confined sedimentary aquifers. In the eastern part of the Basin, surface water use is limited due to low rainfall, flat topography and high infiltration rates which limit construction of surface water impoundments. Groundwater recharge in this part of the Basin is enhanced by riverbed and flood infiltration along the river valleys during time of flooding and releases from the Challawa Gorge and Tiga dams). Estimated annual groundwater availability varies from 2,317MCM/yr in 2018 to 1,279MCM/yr in 2019 (SMEC 2017. It is estimated that by 2040, annual sustainable groundwater availability will decrease to 70% of the current estimated volume due to climate change, assuming a decrease in rainfall.

Groundwater occurrences revealed the hydrogeological maps compiled for this study revealed that groundwater is available in three media which are: - Alluvial Aquifer, Soft Overburden Aquifer and Fractured Crystalline Aquifer. The Alluvial Aquifer are found in Rivers e.g. River Kurma, River Takwami, and River Magaga, which are perennial containing water during the dry season. These aquifers are important for small scale irrigation by shadoof system called *Jigo in Hausa* to water crops and vegetable like onions, tomatoes etc. during the dry season.

Soft overburden aquifer consists of saprolite and regolith and is derived from the weathering product of the Basement Complex rocks of elluvial and alluvial origin which makes it heterogeneous. Most of this aquifer are tapped by hand-dug wells and are seasonally bearing water in wet seasons and some at end the of the dry season. This aquifer covers most parts of the Project area with a minimum depth of 6 m to maximum of 32 m. On the other hand the Fractured Crystalline Aquifer is also perennial and continuous throughout the year and can be tapped by borehole.

# 5.26 Baseline Groundwater Quality

The Physico-chemical analysis results of groundwater collected in the project area during wet and dry seasons are presented in *Appendix 5.* The quality of the groundwater samples was compared with WHO drinking water quality index, with most of the parameters recorded

to be within WHO drinking water quality index. The water is generally clear and unobjectionable in terms of odour and other physical appearances.

#### Physico-chemical Description of groundwater (Wet Season)

The ground water pH for the wet season ranged was 7.34 while the control value was 7.83. (*Appendix 2*). These values show that groundwater around the project area were slightly basic and were within the WHO limit of 6.5 - 8.5 for drinkable water. The water temperature ranged from 28.9 - 32.70 °C. The water Total Dissolved Solid was 561 mg/L while the control was 812 mg/L. Total Suspended Solids was 11 mg/L while the control was 15 mg/L. The TSS values were below the 30 mg/L limit by FMEnv. Electrical conductivity varied between  $1270 \text{ and } 1681 \mu\text{S/cm}$  for the sample and control sample.

The groundwater Dissolved Oxygen (DO) recorded was 4.90mg/ while the control was 4.40mg/L. The groundwater Chemical Oxygen Demand (COD) values as an indicative measure of the amount of oxygen that can be consumed by reactions in a measured solution were generally low. The groundwater Biological Oxygen Demand (BOD<sub>5</sub>) as the amount of dissolved oxygen needed (i.e. demanded) by aerobic biological organisms to break down organic material present in a given water sample at certain temperature over a specific time period has a value of 2.40mg/L while the control was 1.40mg/L.

The groundwater water cations were dominated by Sodium (Na), Calcium (Ca) and Potassium (K) as presented in Table 5.11. Sodium was 45mg/L while the control value was 28.00mg/L. Calcium was 1.67mg/L while the control value was 0.23mg/L. Magnesium was 3.67mg/L while the control value was 0.41mg/L. Also Potassium was 2.61mg/L while the control value was 1.20mgL. During the study, the heavy metal concentration values were low in all the sampling locations except for Iron in the control site which was in excess of the recommended state (Table 4.4). This may be attributed to the local geological variation in the area.

Groundwater hydrocarbon concentration is a very important quality monitoring parameter for oil and gas activities, as it can be used to detect any oil related ground water pollution. Hydrocarbon concentration of the ground water was generally low during dry season study, and not even detected in most sampling locations during wet season *(Table 5.17)*. This is an indication of no oil pollution in the project area. Both seasons' hydrocarbon concentrations are within FMEnv limits.

#### Table 5.17: Statistical Summary of Physico-chemistry and Microbiology of Ground water

Fieldwork

### 5.26.1 Soil Physical and Chemical Properties (Dry Season)

The soil pH ranged between 7.31 –8.02 and falls within the pH values recommended by FAO (6-9) for optimum crop production. The Electrical Conductivity of the soil samples ranged between  $103 - 174.6 \mu$ S/cm. Sodium concentration is very low and ranged between 0.4 - 0.55 mg/kg indicating low soil salt content as was also recorded during the wet season. In general, the concentration of soil anions, cations and nutrients in the soil samples were lower than those of the wet season except for Manganese, indicating lower soil fertility during the dry season. The concentration of organic carbon ranged from 1.33 - 2.32% higher than those of the wet season. The concentrations of heavy metals were generally lower in dry than wet season as most of the metals including Cu, Cd, Cr, As and V were not detected in dry season soil samples. The concentration of Ni was 8.02 mg/kg, Pb ranged from 0.86 - 3.12 mg/kg while Zn ranged from 137.7 - 213.7 mg/kg, Zn being the only metal with higher concentration during the dry season (Table 5.18).

ESIA for the Proposed Tin Mining Project by Century Mining Company Ltd at Riruwai Community, Doguwa LGA, Kano State

# 5.27 Groundwater microbial analysis

Both the total coliform count and aerobic mesophilic bacteria count are within the satisfactory and acceptable limits in both the project control sites (Table 4.4). This indicates that the groundwater which is the major source of water in the project area had not been significantly contaminated.

# **Quality of drinking Water**

The global indicator for tracking progress towards the SDG drinking water target (SDG 6.1) is the use of 'safely managed drinking water services', defined as an improved drinking water source that is accessible on premises, available when needed and free from contamination.

The Nigeria MICS 2016-17 recorded whether households used sources located on premises, whether water sources provided water every day in the last two weeks and also included direct measurement of microbiological quality of drinking water at both the source and the household level. Microbiological characteristics of drinking water are used to describe the presence or absence of microbiological organisms and water - borne pathogens. E.coli is a member of the faecal coliform group and is a more specific indicator of faecal pollution than other faecal coliform and often used to measure the degree of pollution and sanitary integrity of drinking water.

The presence of E. coli in water has adverse health effects on infants, the elderly and those with compromised immune systems. In extreme cases some pathogens may infect the lungs, skins, eyes, nervous system, kidney or liver and the effects may be more severe, chronic, or even fatal including stunting among children. Aside disease-causing pathogens there are also physical, chemical, trace elements (heavy metals) and organic contaminants that its presence in drinking water may have profound aesthetic and harmful effects on public health. Achieving water quality standard that meets Nigerian Standard for Drinking Water Quality: NIS-544- 2007, revised 2015, is a mandatory prerequisite for water destined for human consumption.

Also, Sustainable Development Goal 6 is access to safe clean water and sanitation for all and sound management of freshwater ecosystems is essential to human health and environmental sustainability and economic prosperity. The bacteria species Escherichia coli (E. coli) is the most commonly recommended faecal indicator, and many countries including Nigeria have set a standard that no E. coli should be found in a 100 mL sample of drinking water.

Tables 5.12 report the levels of contamination of drinking water from a glass within the home and from a water sample obtained from the water source. It also combines information on the quality, availability and location of drinking water sources to provide estimates of safely managed drinking water services for Nigeria.

# Sources and Quality of household drinking water

Over fifty percent of the population has access to improved drinking water sources (Figure 5.27). This access was made possible through water vendors that supply pipe borne water to various households in the area.

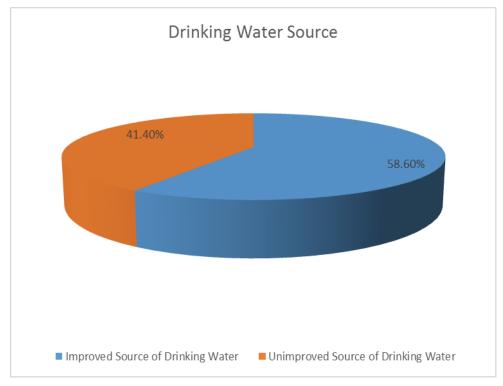

Figure 5.27: Water Sources in Kano State (NDHS, 2018)

However, according to the Kano State Multiple Indicator Cluster Survey 2016-17 Final Report May 2018, about 97 percent of rural household members drink water contaminated by E-Coli.

This is of public health concern as almost everybody in Kano drinks faecal contaminated water which has an adverse health effect. The source of water can also determine the level of contamination in household drinking water. E-coli contamination is lowest in a household where they drink sachet and bottled water (78.7 percent) and highest among those who fetched drinking water from well and springs (100 percent). Although there is a marginal difference in all social group in Kano State, faecal contamination of household drinking water is 100 percent in Kano North, well and spring source of drinking water (protected and unprotected), where household head is not educated, and poorest to middle wealth index quintiles.

In about four out of 5 households in Kano State, drinking water is contaminated by E-coli at the source. This occurred more if they drink water from sources such as well and spring (protected or unprotected), rainwater collection and tanker-truck with cart. E-coli contamination at the source of drinking water is also high in the urban areas, where household head is not educated and poorer wealth index quintile households (Table 5.19 and Plate 5.9). Table 5.21 shows the Percent distribution of household population according to faecal contamination risk as assessed by levels of E. coli in household drinking water, and percent of household population with E. coli in drinking water Nigeria, 2016-17 Kano State.

Table 5.19: Percent distribution of household population according to faecal contamination risk as assessed by levels of E. coli in, Kano State 2016-17

Plate 5.9: Sources of Drinking Water In Karaye/Rogo Community of the project Area

# 5.28 Vegetation Characteristics

The vegetation of the area was originally a type of Savanna, typical of the savannah vegetation of Northern Nigeria made up of various species of grasses, bushes and trees. Overtime however, intensive cultivation has considerably changed the natural vegetation, which now only exists in relatively small pockets in non-arable areas. The bulk of Kano state where the project area mainly lies is classified as the Sudan Savanna Zone. However, the northern part of the state is markedly drier than the project area which is more southerly. Park land trees are common in the project area but the numbers of such trees are rapidly reduced due to cutting for firewood. In the especially as witnessed in the pilot sub-watershed 1 (PSW\_1) project area coppice-type vegetation growth is common, resulting in a reduction in the amount of grass and an increase in the amount of woody shrubs, thereby making

209

animal grazing difficult. More over the intensive and space-wide cultivation common in the project area further complicates the opportunity for open grazing especially during the growing season as virtually no part of the lands are left uncultivated, sparing only bush paths.

Vegetation of the Area was originally defined as undisturbed Sudan savanna and guinea savanna. The normal vegetation has always been the dry Guinea in the southern fringe and the Sudan in the larger part of the region (Olofin, 2008). The vegetation has now been subjected to destruction through fuel wood extraction, urban encroachment and population pressure; thereby result in the formation of four vegetation zones in the region namely: Sudano Sahelian Savanna, Sudan Savanna, Open Guinea Savanna and Protected Guinea Savanna (Adamu, 2004).

There are thorny shrubs and small tree species which normally cover the forested area of the basin and abandoned areas of irrigation cultivation. Peculiar among the thorny shrubs are *Isoberhnia, Acanthospermum hispidum* and *Guiera Senegalensis* to mention but a few. Grasses are the main species of vegetation that dominate both cultivable and uncultivated lands, and these include *Striga gesneriooles, Pennisetum pol ystachion,Cyperus rotundus* and many others. Some of these grasses as well as tree species are regarded as cultural vegetation. These include neem, guava, mango and cashew. These vegetation species dominate most parts of the channel width with average height of 1.5m, while mango, guava and cashew are purposely planted for sale as cash crops in irrigation plots. The neem trees are found in the rural settlements and sometimes in the upland farms to provide shades for the farmers.

The type of trees in Sudano Sahelian Savanna of Kano Region include A nilotica.(bagaruwa) Neem (Darbejiya) and adansonia digitata (Kuka). Both trees, shrubs and grasses are scattered, the dominant tree Species is Azadaradita indica (Neem). While the Dominant grass is *Cassia tora* (Tafasa) and thorny Shrubs like *Zizuphus Jujube* (Magarya). Most of the trees are adapted to drought condition for the fact that they are large and have leathery leaves. Some of threes include *Parkia biglabosa* (Dorawa), *Tamarindus indica* (Tsamiya) and *Mangifera indica* (Mango). *Cassia tora* (Tafasa) and *Senna occidentalis* (Rai-rai) are the grasses of this area.

Within the region, there is disparity between the northern and southern parts. In the southern part more intensive agricultural activities is practiced both in the dry and rainy seasons, while in the northern part there is low vegetation growth. There is high level of vegetation setback along Hadejia Jama'are wetland as well as the challawa dam site caused by emergence of *Typha grass*. (Dakata and Yelwa 2012).

Field observation and public consultation also revealed a good number and variety of plat species found and used in the area. These are summarized in table 5.20 below.

| S/N | Scientific name          | Common name            | Habit | Local uses                    |
|-----|--------------------------|------------------------|-------|-------------------------------|
| 1   | Acacia nilotica          | Acacia                 | Shrub | Source of Gum and Tannin      |
| 2   | Acacia sengal            | Acacia                 | Tree  | Source of Gum and Arabic      |

# 5.29 Fauna Characteristics

The site is characterized with few vertebrate species comprising of white egret and agama lizards (Table 5.21. The low fauna diversity could be attributed to the industrial land use that dominates the study site.

### Table 5.21: Fauna Composition

| Common name         | Scientific name |  |  |
|---------------------|-----------------|--|--|
| Aves (Birds)        |                 |  |  |

| Agama Lizard        | Agama agama     |  |  |

# Biodiversity of fish species from Challawa Gorge Dam

In a recent study of fish species diversity of Challawa, Nazeef and Ibrahim (2018) identified not fewer than 10 species belonging to nine families over a six months study period including both dry and rainy seasons March to August (Table 5.10 and Table 5.11).

The authors based their findings on a sample of three fish landing sites (Feginma, Turawa, and Sakarma). Samples were obtained from the local fishermen at each of the landing sites. Fishing gears that were used by the local fishermen includes gill and cast nets of different mesh sizes (2, 2.5, and 3 inches). Findings show that fish family *Mormyridae* had the highest number of species represented by *Marcusenius isidori and Marcusenius senegalensis,* while other families were represented by one species each. Family *Bagridae* was represented by *Bagrus bayad macropterus*. Family *Latidae* represented by *Lates niloticus*, family *Alestidae* 

was represented by Brycinus nurse, while *Oreochromis niloticus* represented family *Cichlidae*, family *Claridae* was represented by *Clarias lazera*. *Auchenoglanis occidentalis* represented the family *Claroteidae*, whereas *Synodontis schall* represented family *Mochokidae*. And *Schilbe mystus* represented the family *Schilbeidae*. (Table 5.22).

| Family      | Species   | English name (Common Local name (Hausa) |                |  |  |  |
|-------------|---|---|----------------|--|--|--|
|             |   | Name)                                   |                |  |  |  |
| Bagridae    | Bagrus bayad macropterus                              | Silver catfish                          | Ragon ruwa     |  |  |  |
| Latidae     | Lates niloticus                                       | Nile perch                              | Giwan ruwa     |  |  |  |
| Alestidae   | Brycinus nurse  | Silversides fish                        | Kawara         |  |  |  |
| Cichlidae   | Oreochromis niloticus                                 | Nile tilapia                            | Karfasa        |  |  |  |
| Claridae    | Clarias lazera  | Catfish                                 | Tarwada        |  |  |  |
| Claroteidae | Auchenoglanis occidentalis                            | Bubu, armored Catfish                   | Buro           |  |  |  |
| Mochokidae  | Synodontis schall                                     | Wahrindi                                | Karaya         |  |  |  |
| Mormyridae  | 1. Marcusenius isidori<br>2. Marcusenius senegalensis | Trunkfish                               | Farinwata Data |  |  |  |
| Schilbeidae | Schilbe mystus  | Butterfish                              | Balo           |  |  |  |

 Table 5.22: Fish species identified in Challawa Dam

Source: Nazeef S. and Ibrahim M. (2018)

Assessment of fish biodiversity revealed 10 species belonging to 9 families with the mormyrids (*Marcusenius isidori and Marcusenius senegalensis*) being the dominant species. *Lates niloticus* has the least distribution, and it is carnivorous. The least number of *Lates niloticus* can serve as to checkmate on the *proliferous mormyrids* species. Condition factor (K value) of fish species identified revealed that 50% of the species investigated had their K value below 1, whereas the remaining 50% had above these values represent below and average wellbeing of fish (Nazeef and Ibrahim, 2018). The most abundant species are *Marcusenius senegalensis* (32.6) and *Marcusenius isidori* (21%). Fishspecies abundance also vary with season, with the Rainy Season especially May to July recording more species than was found in March to April.

| Species/Month   | March | April | May | June | July | August | Total | Abundance % |
|-----------------|-------|-------|-----|------|------|--------|-------|-------------|
| Auchenoglanis   | 0     | 0     | 31  | 56   | 20   | 16     | 123   | 2.87        |

# Table 5.23: Fish Species diversity of Challawa Gorge Dam

Source: Nazeef S. and Ibrahim M. (2018)

The maintenance of good Physico-chemical parameters and their influx into water system, sufficient regulation of fishing and its practices, non-selective gears restriction and enforcement by relevant authorities and public enlightenment on the dangers of biodiversity loss can greatly enhance and maintain the dynamics of the dam. In addition the present knowledge of diversity of fish species in the Challawa water may serve as bases for future audit of likely effect of the project on biodiversity.

### 5.30 Land Use

In most parts of Nigeria, land use had been determined by tenurial systems evolved over time and determined by the perceived demand as well as the potential and actual social pressures associated with its supply and use (Powell, 1995; Swallow and Kamara, 2000). Land use in the study area comprises the built environment including residential and nonresidential buildings, industrial buildings, cultural lands such as religious grounds, cemeteries, recreational grounds, roads and paths, market places etc. Other land uses include agricultural lands, forest cover, etc. The project site and its environ were visited to obtain familiarity with the landscape and surrounding countryside areas. Field studies have included the recording of landscape features, the evaluation of landscape character and quality, and establishment of representative viewpoints. Desk studies have been carried out including a study of the local topography and land use using maps, aerial photographs and photographs taken during field studies and reference to other ESIA reports for projects around the study area (including ESIA (2017) for the Hadejia Jama'are Sub-Basin with Kano River Irrigation Scheme (KRIS) and Hadejia Valley Irrigation Scheme (HVIS), and the ESIA for Transmission Company of Nigeria Project Management Unit (TCN-PMU for the 330/132/33kV Transmission Substation New Kano, Kano State SMEC March, 2017).

The land cover on farms is mainly crops grown by farmers with scattered trees of average to large height and size. The trees are mainly locust bean, tamarind, local mahogany, guava, neem (*darbejia*), and mangoe trees. The uncultivated patches of land around the settlements, there are other species such as Dorawa, Dinya, Kanya (Hausa names for the trees) and many others of economic and medicinal values. The tree density improves and in some cases forms clusters on uncultivated/uncultivable lands especially around the main and figure gully banks. There are shrubs and grasses that grow freely in several locations within the area. Figure 5.28 and figure 5.29 fairly depict the land use/land cover types in the two pilot sub watersheds of the project area. On both pilot sub-watersheds, the lands are intensively under crop cover especially in the rainy season, while eroded areas are generally uncultivated or uncultivable. There are patches of built up areas of small to medium size settlements on both pilot sub-watersheds.

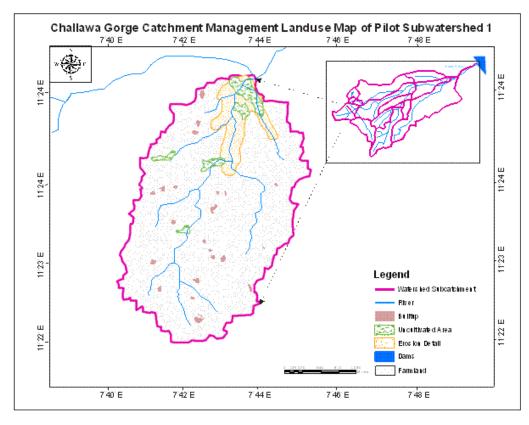

Figure 5.28: Land use Map of the Study Area Pilot Subwatershed\_1

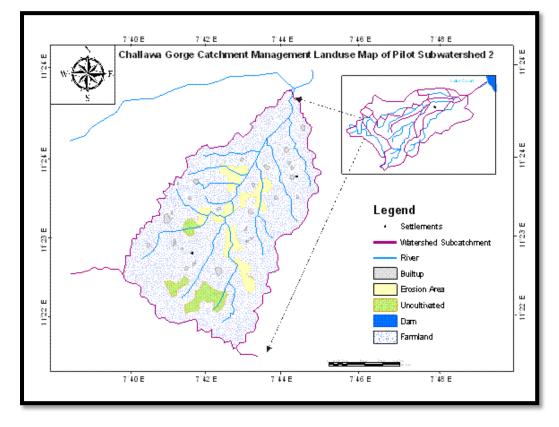

Figure 5.29: Land use around Pilot Sub-Watershed\_2

The settlement system consists of permanent structures made from grass, wood and sand (Plate 5.10) and, in a few cases, concrete blocks and iron roofs (Plate 5.11). The main settlements are Karaye and Rogo which are LGA headquarters. Several other towns such as Tsara and Soho Rogo are fairly big towns with many other smaller villages and Fulani herdsmen huts scattered around.

The estimated population of the area is around 250,000 people. The estimated population age structure the pilot areas and in the immediately surrounding hamlets is on average between 30-40 years. The area is also doted by small hamlets mostly made up of 2 to 5 families per hamlet, with demographic structure of more children and youths compared to adults and with fewer males than females. The family system is mainly monogamous but it is mostly dictated by economic resources of the man. The average number of births per woman is six and each household has about eight to ten people.

# 5.31 Socio-Economic Environment

A socioeconomic assessment of the project area gives an insight into the social, cultural and economic conditions in the project area. A blend of methods including the following, were adopted for data to gathering.

- v. Review relevant literature;
- vi. Review of existing, reports of Nigeria Demographic and Health Survey ;
- vii. Reconnaissance survey to identify the focal communities (Karaye, Rogo, Kiru L.G.As) and the likely adjoining communities that might be directly or indirectly affected by the proposed project;
- viii. Focus Group Discussions (FGDs) with stakeholders and project affected peoples (PAPs) in areas closest to the footprint locations of the project.

The focus group discussions were held at various times and in different areas of proposed project site between May and July 2021. The stakeholders during the FGD are shown in Plates 5.12(a, b and C).

# Population

The age and sex structure of population in Kano state (Tables 5.12; 5.13 and Fig. 5.30) depicts the unique outlook of the state's population. About 47% of the population is aged 0 - 14years, 48% 15 to 59years, while the remaining 5% are 60years and above. This suggests not only the youthful nature of the population but also its vulnerability to rapid growth.

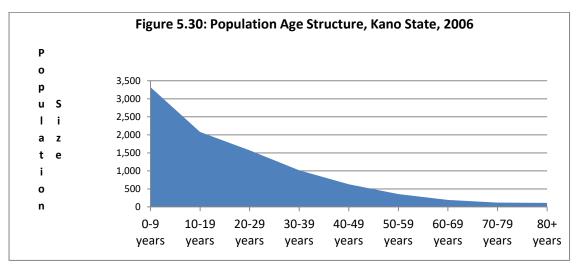

Moreover, the sex ratio is moving concurrently between male and female with a slight difference of 1.6% in 1991 and about 2.5% in 2006 (See Table 5.24). Thus the sex distribution index (number of males per 100 females), depicts an inconsiderable excess of males in the state.

| Table 5.24 Age Structure of Population, Kano State 2006 |            |             |              |  |  |  |  |  |  |
|---|------------|-------------|--------------|--|--|--|--|--|--|
| Age Group   | Population | Percent (%) | Cumulative % |  |  |  |  |  |  |
| 0-9 years   | 3,322,489  | 35.3        | 35.3         |  |  |  |  |  |  |

Γ

Another remarkable issue is the population - land ration. With a total land area of 21,276.87Km<sup>2</sup>, Kano state had in 1991 contained an average of 273 persons per square kilometre but in 2016, the density had increased by about 1.6 times (over 150%) with a density of about 441/Km<sup>2</sup>.

Table 5.26: Projected Population for three riparian Local Governments of Challawa Gorge Dam Project Area

| Local Government | Projected       | Land Are (km <sup>2</sup> ) | Population               |
|------------------|-----------------|-----------------------------|--------------------------|
| Area             | Population Size |                             | density/ km <sup>2</sup> |
|                  | (2016)*         |                             |                          |
| Karaye           | 200,400         | 419.9                       | 477.3                    |
| Rogo             | 316,600         | 801.8                       | 394.8                    |
| Kiru             | 371600          | 937.1                       | 396,5                    |
| Total            | 888,600         | 2158.8                      | 411.6                    |

NB:- \*3.4% Annual Population Change 2006  $\rightarrow$  2016) base year 2006.

Three most central local government area that make up over 80% of the Challawa Gorge Dam Watershed area are Karaye, Rogo and Kiru LGAs with a total projected 2016 population of 888,600 and total land area of 2158.8 km<sup>2</sup>. The projected population density of 411.6/ km<sup>2</sup> for the three riparian Local Government Areas is in agreement with the estimation of Adamu (2016). The implication is that both positive and negative impacts of the Watershed management project may cascade to affect a fairly large number of people and therefore will require a well-designed ESMP plan.

### **Settlement Characteristics**

The settlements system consists of permanent structures made from grass, wood and sand and, in a few cases, concrete blocks and iron roofs. The main settlements are Karaye, Rogo and Kiru which are LGA headquarters. Several other towns such as Tsara, Turawa and Soho Rogo are fairly big settlements with many other smaller villages such as Unguwan Datti, Dayi and temporary Fulani herdsmen huts scattered around.

The estimated 2016 population of the most affected areas is 888,600 people. The estimated population structure of the people living in the area and in the immediately surrounding hamlets was an average of 30-40 people, mostly constituted of 2 to 3 families per hamlet, with demographic structure of more children and youths compared to adults and with the less males compared to females. The family system is mainly monogamous but it is mostly dictated by economic resources of the man. The average number of births per woman is six and each household has about eight to ten people. The economic activities are mostly farming and commerce. Both men and women participate though with different roles. On the farm, the men mostly do the tedious jobs of cultivation, making of ridges/canals for water reticulation and transportation of harvested crops to markets for sales and to homes for food, while the women participate in planting, weeding and harvesting. In families that have no men, the women do all the tasks.

The 2015 population and average population density for each of the four main sub-basins is given in Table 4.1 of the HKY Basin is about 200 persons/km<sup>2</sup>. This indicates that the Basin is the most populated area in the northern region of the country. The Challawa Gorge Dam Sub-basin area which lies within the Kano Close Settled Zone with its high population density is exerting pressure on the water resources of the area. The population of the region is mainly engaged in both rain fed and irrigation farming, in addition to other non-agricultural commercial activities including marketing of agricultural commodity.

Land Tenure: Land ownership is vested in the state. Farmers hold usufructuary rights, and the rights to a particular piece of land can be passed on by inheritance, sale or rental. The land owned by a particular family is often in fragmented holdings within a varying radius of the village. Islamic inheritance law has resulted in continuous subdivision of existing holdings among family members. The two main customary forms of land tenure are gandu, under which the land right is vested in the family head but the land is worked and its produce shared by all family members, and gayauna, under which the land is worked by the family member who has the right to its use. The gandu is of particular importance as it enables the individual to hold off-farm employment while still enjoying the benefits of agriculture. Land pressures have mounted due to population growth, continual, land accumulation by wealthy individuals, and public requirements (roads, schools, irrigation schemes, etc.)

#### Land Use, Farm Structure & Farm Enterprise:

It is estimated that over 60% of Kano State's 43,000 km2 land area, some 2.6 million ha, is under cultivation. In the densely populated areas of Karaye, Rogo, Challawa, `80-90% of the cultivable land in the area is cultivated. The bulk of the agricultural lands are upland and used for rainfed crops such as sorghum, millet, cowpeas, groundnuts, maize, and cotton. In addition to the upland areas, a considerable agricultural potential does exist in the valleys along the main river systems (Challawa, Gumshi, Tankwarya etc), known as fadama lands. Accurate data are not available but it has been estimated that the main fadama systems and their floodplain areas cover about 48,000 ha in the project area. During the rainy season rice, maize, sugarcane, sorghum, and some tobacco are grown in the fadama lands, while onions, tomatoes, other vegetables, and wheat are grown during the dry season under irrigation. This is very common around challawa gorge dam site and near major tributaries to the challawa river especially Gumshi river bank. On the fringes of the fadama lands, sorghum and maize are the main crops.

**Farming System:** Cultivation is overwhelmingly carried out by hand, although tractors are also used in some cases especially by large scale farmers.

Work-oxen are very common both as a tool for farming and beast of burden to convey agricultural products, firewood, etc. from the farms to home. Fadama areas are worked intensively to produce high value cash crops, but most farm enterprises are rainfed. There is no evidence of any particular rotational system, because intense land pressure has reduced or eliminated the fallow period in virtually all parts of the project area.

Individual farm holdings vary in size from as small as 0.2 ha in areas near major settlements such as Karaye, Kiru, Rogo, Tsoho Rogo, Zarewa, and Getso and on Fadama lands, to land holdings in excess of 20 ha. The average farm holding (both family and individual holdings) in the area is about 2.5 ha. Farms are generally fragmented and the sizes vary significantly due to the influence of population expansion and inheritance system under Islamic laws. Most of the cultivators (75%) are Hausa, the remainder generally being settled Fulani pastoralists (who now cultivate crops as well as keep animals, and other migrant ethnic groups from other parts of the country including Kanuri and people of Yoruba extraction. Families generally have 5 - 8 members with a mean of 7.4 persons per family in the project area.

**Farm Labor**: Family members provide about 85% of total on-farm labour input on an average traditional farm. Non-family labor is provided by hired laborers, engaged at rates

ranging from N700 to N1000 per day depending on the type and intensity of work, or on a piece-rate basis, and in some instances by traditional reciprocal labor *(Gaiya)*.

Religious and social restrictions tend to limit adult female input to threshing and processing of agricultural produce in the family compound. The bulk (55-60%) of family labor input to on-farm activities is provided mainly by adult males. The share of children-supplied labor is minimal generally restricted to tendering for domestic livestock, gathering firewood and fetching water. In a few instances some children and the adolescents are involved in planting, weeding and harvesting on farms. On-farm activities on the traditional farms are highly seasonal, with 90% of family labor input being supplied from June to November.

**Crop Production:** The bulk of agricultural production comes from manually cultivated rainfed crops. Fadama areas contribute substantially to the farmer's income as they produce most of the cash crops, mainly during the dry season. The most important crops produced in the area where rainfall is higher, maize, cowpeas, guinea corn, groundnuts and sweet potatoes are popular.

Intercropping of two or more crops is very common. About 85% of the farmers reported that mixed cropping or intercropping of two or more crops on the same piece of land is highly beneficial as it permits filling-in of a crop which may not have germinated well, increase the average cropping density on the farm and therefore provides better utilization of available soil and allows adjustment to uncertainty in the event that one crop may fail due to unexpected drought, insect pest attack, and other unforeseen environmental events. Farmers start the season by planting food crops first, usually millet, which may have sorghum or other crops subsequently planted with it. For most (87%) farmers interviewed, there appears to be no evidence of any particular rotational system practiced. Rather, the choice of crops mainly depends on the farmer's particular food needs, market conditions, agro climatic conditions and location of fields in relation to their houses.

#### Levels of Education

It is evident that the trend of educational development in kano state deliver a sound labour force in the near future. Analysis of educational attainment of the subjects in the region reveals about 46% uneducated persons (Table 5.29 and 5.30). Thus, there is a large size of unskilled labour that possibly relies mainly on agriculture and other unprofessional livelihood activities. This probably partly explains the relatively low cost of labour (less than about #2000/8 work hours) in a day in the area. In fact this scenario is corroborated by Maigari (2012) that the cost of a day man-work (8 hours; 8.00am to 4.00pm) is generally low, ranging

from =N=500.00 to =N=2,000.00, while wages and salaries of casual workers ranges from =N=6,000.00 to =N=20,000.00 per month.

# Table 5.27: Percentage Distribution of Educational Attainment 6 Years and Above

| Educational Status | Kano State |          |         |

Source: National Population Census, 2006

#### Gender

Gender inequality continues to be linked to various traditional practices of many cultural groups in Nigeria. Many cultures promote the belief that, women do not have an identity of their own but those derive from men. The different ethnic groups engage in practices which degrade and discriminate women. In Nigeria, the belief that male issues are more important than female is rampant. Even in issue of education, some families prefer to educate male child at the expense of the female. This is one of the reasons why illiteracy rate is higher among women than men especially rural dwellers in Nigeria. Studies across gender issues in Nigeria disclosed the following factors as major contributors for the prevalence of gender inequality in the basin: Environmental Factors: the environment in Northern region of Nigeria, in general, and HJKYB in particular is not favourable to the development of women due to the problems of desertification and drought and all these are gradually heighted by the impact of climate change. In the North, men and women play different roles in the family.

Women are engaged in the household subsistence activities and highly depend on the environment for their tasks; they are expected to cater for the welfare of their children in polygamous marriages. The traditional division of labour gives the rural women in the North responsibility for providing and managing natural energy sources required for the maintenance of the family household, desert encroachment and drought in the northern region places a special extra burden on her. Poor supply of food and water due to environmental factors increases the women hours she will devote to fetching clean drinkable water, gathering forest and water products, which are crucial for food supplement, and firewood for domestic use.

#### 5.32 Economic activities and sources of income

A socioeconomic assessment of the project area gives some insight into the social, cultural and economic conditions in the project area. A blend of formal and informal interviews, FGD and stakeholder engagements methods, which include the following, were used to acquire the socio-economic data.

Kano is the commercial and investment hub of Northern Nigeria and probably the largest non-oil and gas economy in Northern Nigeria. The Economy of Kano state is driven largely by commerce, manufacturing and subsistence agriculture. Predominantly however, the population in Kano State and the project area in particular, is engaged in agriculture either as full time or as a vocation, in addition to other livelihood businesses. The sample survey shows agriculture engages up to 70% of the population directly or indirectly. The informal sector is strong and diverse, with numerous Micro, Small and Medium Scale Industries (MSMEs) and the informal sector (hawking, show-shining, cobbler, road-side food vending (especially by women), etc. across all economic activities and across all the local government areas, contributing approximately 60 – 70% of output and employment (Public Consultation views).

The State has historically been a major commercial and manufacturing centre in the West African sub region in general, and Nigeria in particular even before the incorporation of the country into the European System of global commerce. It has been a major entry port and southern hub of the trans-saharan trade route for centuries.

Economic activities are mostly farming, commerce/trading, informal businesses such as hawking of processed food by young girls and other forms of street food vending by older females including married women within the settlements, shoe shining by young uneducated youths, water vending etc. On the farm, the men mostly do the tedious jobs of cultivation, making of ridges and irrigation canals for water reticulation and transportation of harvested crops to markets for sale and to home for food, while the women participate in planting, weeding and harvesting. In families that have no active men, the women do all the tasks.

Animal husbandry is not very common and stocks are very few averaging 2-10 per family. Bulls are more common because they serve as farming tools and transporting goods and materials. The bulls used for ploughing on farms also serve as means of income where they are used in ploughing for pay/cash. The children, boys only, attend to the animals mostly while the women household domestic duties including fetching firewood, participating in weeding on farms (Plate 5.13) and harvesting and processing crops for food and for sale at the local markets. The commercial activities are mostly smaller trading with some bigger traders selling grains and animals.

Plate 5.13: Women weeding rice farm at Unguwan Gauda Community

The major communities are serviced by grade three tarred roads mainly within the town and highways traversing the settlements. Many of the roads are dilapidated while most of the remote areas have no roads at all. Where there are roads they are accessed by laterite surfaced roads, or dry season motor roads and in several cases bush paths. (Plate 5.14).

ate 5.14: Laterite surface road Traversing a village area

ΡI

There are several public primary schools, junior and senior secondary schools, primary health care facilities and television viewing centres with enrolments ranging from 50 in the smaller settlements to a few hundreds in the major towns (LGA Headquarters).

Plate 5.15: Public Secondary School at Rogo

There is public power supply system from the national grid in the main towns but no power supply to the smaller villages in the project area. Consequently, the major source of power is fuel wood and farm waste which are sourced from dead trees, shrubs and cornstalks. Some utilize generators and solar panels but mostly for commercial phone charging. There are periodic markets (Plate 5.16) gathering after every seven days which is typical of most periodic markets in the Kano Region and in Northern Nigeria, police stations and local cinemas (privately owned commercial television viewing centres) at some strategic locations. The tarred roads and paths that exist are plied by trucks and animals for the transportation of goods to and from farms, and to local markets.

Plate 5.16: Village Periodic Market looking deserted on a non-market day

## Wealth Distribution

Wealth distribution in Kano State according to the Nigerian Demographic and Health survey Report (2018) has a Gini coefficient of 0.26, indicating that wealth is unevenly distributed in the area as over 50% of the population falls in the second and lowest quintiles. This is attributed to diversity in earning potentials of the various occupations people engaged in (fig. 5.31).

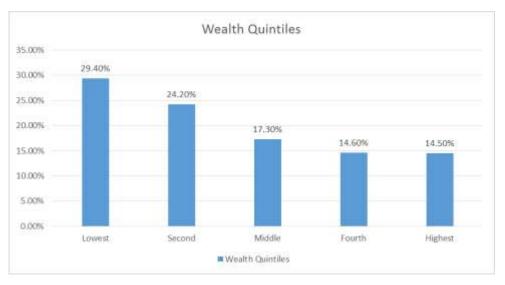

Figure 5.31: Wealth Quintiles (NDHS, 2018)

#### 5.33 Religion and Believes and Languages Spoken,

**Religion:** A large number of the Hausa population is Muslim practicing Islam, based off the teachings of the prophet Muhammad and the instructions of the Holy book, Qur'an. It is said that the religion was brought to them by traders from North Africa, Mali, Borneo, and Guinea during their trade exchanges, and they quickly adapted the religion. Muslims pray five times a day, fast during the month of Ramadan and strive to make the pilgrimage to the holy land in Mecca.

Conservative estimate put the population of Muslims in Kano State to about 90% followed by Christians mostly non-hausa. Since the penetration of Islam into Hausa land in the mid-14th century, most Hausa have become extremely devoted to the Islamic faith. Muslims believe in Allah and Mohammed as his prophet. They pray five times each day, read the holy scriptures, fast during the month of Ramadan, give alms to the poor, and aspire to make the pilgrimage (hajj) to the Muslim holy land in Mecca. The religion affects nearly all aspects of Hausa behavior, including their dress, art, house types, rites of passage, and laws.

In the rural areas, there are still a few communities of people who do not follow Islam. These people are referred to as *Maguzawa*, who are linguistically and culturally Hausas, but they worship nature spirits known as *bori* or *iskoki*. *Bori* cults are built around spirit possession and exorcism and are especially attractive to women and the socially marginalized peoples. A number the *Maguzawas* practice the Christian faith. Within the Challawa project area the *Maguzawa* community are found in small farming villages of Rogo Local Government Area.

**Hausa language**: was described as the most important indigenous lingua-franca in West and Central Africa, spoken as a first or second language by about 40–50 million people. It belongs to the Western branch of the Chadic language superfamily within the Afro-Asiatic language phylum. The territories of the Hausa people lie on both sides of the border between Niger. About one-half of the population speaks Hausa as a first language, and in Nigeria, where about one-fifth of the population speaks it as a first language. The Hausa are predominantly Muslim. Their tradition of long-distance commerce and pilgrimages to the Holy Cities of Islam has carried their language to almost all major cities in West, North, Central, and Northeast Africa.

The official language of Kano State is English but the Hausa language is commonly spoken. The state is mostly populated by Hausa people. Kano state located at the north western part of Nigeria is inhabited natively by Hausa and Fulani ethnic groups. Hausa is the most widely spoken language in the state. One can find it extremely difficult to live in the state without being able to speak at least some few Hausa life-saving words and phrases. Kano is the home of Hausa, everything about the language is being set here. There are however, vibrant communities of all the ethnicities of Nigeria and some neighboring countries speaking various languages including Igbo, Yoruba, Igala, Idoma, Kanuri, etc among several other Nigerian Languages. On the other hand too, there Lebanese, Syrians, Indians and Chinese among other foreign nationals are visible in the state.

The Hausa are predominantly Muslim. Their tradition of long-distance commerce and pilgrimages to the Holy Cities of Islam has carried their language to almost all major cities in West, North, Central, and Northeast Africa. The Project environment lies at the heart of Hausa language zone and may have significant implications for the Challawa Gorge Dam Watershed management project execution and implementation especially in terms of labour hiring and human relations.

**Culture and tradition:** The Hausa people have unique cultural practices that have stood the test of time regardless of the colonization of the British. This is attributed to the fact that their political and spiritual leaders did not compromise the standards they were well acquainted with; this is why they still maintain their ways of life t in traditions, belief system, values, religion and economy to date.

**Culture and Rites**: Encyclopedia.com, (an open source Journal) has chronicled the Hausa culture lucidly in the following ways. Culture *(al-ada* in Hausa) is one of many features that distinguish a Hausa person from members of other ethnic groups, in addition to his origin *(asali)*, his adherence to the Islamic religion *(addini),* and his mastering the Hausa tongue *(yare)*. Hausa culture includes the Hausa mode of dressing, particularly the big gown and cap, along with several other customs, such as dancing and marriage ceremonies. The Hausa also identify closely with their music, particularly that of the praise-singers who sing about community histories, leaders, and prominent individuals. Hausa culture also includes individual character, known as *mutumci* or *hali*. In their personal dealings, Hausa seek to strike a balance between being assertive and being thrifty, which benefits them in their business dealings, and having a strong sense of shame *(kunya)* and respect among strangers as well as kin just like their Fulani counterparts.

The Hausa calendar follows the Islamic calendar. Feast days *(Id)* take place following the month of fasting *(Ramadan),* following the pilgrimage to Mecca *(hajj),* and on the birthday of the prophet Mohammed *(Maulud)*.

At this time, families usually sacrifice a ram in thanksgiving, celebrate with their relatives and friends, and give each other gifts. Hausa also observe the national holidays of Nigeria.

With a population of over 30 million, the Hausas are one of the largest ethnic groups in West Africa. They are a people of diverse cultural practices with similar homogeneous beliefs and customs exclusively found among their people. Here's everything you need to know about their diversity. The Hausas are concentrated mainly in the northern part of Nigeria, as well as the adjoining south eastern Niger. They also populate parts other countries including Cameroon, Ghana, Chad, Togo, Senegal, Côte d'Ivoire, Sudan and Gabon.

The Hausa states, also known as the Hausa land, were independent political entities founded by the Hausa people, and situated between the River Niger and Lake Chad. It was a political entity with no central authority, isolated up until the mid-14th century. Irrespective of their placements, they had a common language, laws, and customs. The Hausas specialized in blacksmithing, fishing, hunting, agriculture, and salt-mining. By around the 1500s, the northern city of Kano had become the most powerful, and was a major trading center in ivory, gold, slave trade, salt, cloth, leather, and grains. Due to their lack of military expertise and a central governing body, they were regarded as loose alliances by the neighboring towns—which made them prone to external domination. All the states remained independent until they were conquered by a prominent Islamic scholar, Usman dan Fodio, in a Holy Jihad (war) between 1804 and 1815, which created the Sokoto Caliphate. It was later abolished when the British defeated the caliphate in 1903 and named the area Northern Nigeria.

**Marriage:** The Hausa traditional marriage is mostly based on Islamic, and not as time consuming or expensive like the Igbo and Yoruba traditional marriage ceremonies. However, the process leading up to the marriage is slightly similar to what obtains in the other regions in Nigeria.

When a man sees the woman he wants to marry, he has to first of all seek permission from her parents. The family of the bride-to-be will then conduct an investigation on the background of the man to determine his religious beliefs, ethics, moral and family customs, as well as every important detail concerning his upbringing.

The groom-to-be if approved by the woman's family, is allowed to see her briefly but any form of physical contact, romance or courting before marriage is highly discouraged. Once the woman accepts the marriage offer, the man sends his parents or guardians as well as elderly relatives

to formally ask for her hand in marriage. However, this may not be the same for all the tribes in the Hausa communities, as each of them have different customs regarding marriage rites, though the process mentioned above is the most common method. On their trip to the bride's family home to seek her parent's consent, the groom's family take along items such as kolanuts, bags of salt, sweets, etc. It is during this visit that the groom's parents will make their intentions known. *Gaisuwa* is a kind of formal approval from the bride's family to the groom's. This is where the bargain for the bride's dowry begins.

Usually, the bride price starts from a minimum amount known as 'Rubu Dinar' in Hausa, an Arabic phrase which means 'quarter kilogram of gold piece', to the highest amount the groom can afford to pay. It is most preferred for the bride price to be as low as possible, because according to Islamic teachings, the lesser the amount paid as the bride's dowry, the more blessings that will come to the marriage. Payment of the dowry is known as *Sadaki*. Also, the wedding date is fixed during this visit, by both families. The process of setting the date is called *Sarana*. The wedding day is called *Fatihah*, and it is the day of joining the two families.

As part of Hausa tradition, it is the duty of the husband to provide a house for the couple to live in, while furnishing the house is the full responsibility of the bride's family. At the wedding *Fatihah*, women are to remain indoors preparing the bride for her new life as a wife, which is referred to as *Kunshi*. The *Kunsh*i is similar to a bridal shower. The wedding reception is known as Walimah, and it is carried out according to the taste of the families involved. It is usually held after the *Fatihah*, and it goes on for a whole day with food and drinks available for family, friends and well-wishers. At the end of the celebration, the bride is taken to her husband's house after receiving pieces of marital advise from parents, aunts, uncles, parents-in-law.

**Household Composition and Size:** Typically a household unit in the study area consists of the Household Head (HHH), and members including wife or (wives because the area is Polygamous), the children and children of relations, sometimes family friends, all dining from the same pot. The house hold type in many cases is the compound type where more than one family or household (HH) share a compound but eating from different pots. On average, a HH is made up of and average of 5 persons. For the Study area an average HH size was (7.5 members) indicating fairly large family sizes, and about 65% (162 respondents) had more than one wife.

This includes younger (male) adults aged 30-40 years. Generally only about 4% of the household were headed by aged females, and this mainly arose from widowhood.

**Rites of Passage:** About a week after a child is born it is given a name during an Islamic naming ceremony. Boys are usually circumcised at around the age of seven, although there is no rite of passage associated with this. At around this same age, both boys and girls start studying the Qu'ranic scripture, which they must learn by the age of 13.

In their mid- to late- teens, young men and women may become betrothed in marriage also following the Islamic culture. The marriage ceremony may take place over several days, first among the bride and her family and friends, when she is prepared for marriage. Male representatives of the bride's and the groom's families contract the marriage according to Islamic law, usually at the mosque. Shortly thereafter, the couple will be brought together, often with a small celebration (Smith, 1965).

**Hausa Folklore:** The Hausa has a rich system of folklore, some of which has been influenced by the Islamic religion. The system includes stories (*tatsunya*)—of animals, men and women, young men and maidens, and heroes and villains—which usually have a moral. Many include proverbs and riddles to help convey a message to the audience, which is often comprised of children. The stories sometimes involve a trickster who appears as a spider and demonstrates both cunning and greed. Hausa folklore also includes exaggerated stories or traditions (*labaru*) of important figures or events in the Hausa past (such as battles or notable rulers). In these, folklore merges with history. The Hausa origin myth includes Bayajidda the serpent slayer who was rewarded by marriage the Queen of Daura, who, in turn, had the founding sons of the Hausa's seven original towns.

#### Leadership structure:

*Traditional Leadership Hierarchy:* In Hausa Land, the emir is assisted by District Heads, Village Heads and Ward heads (*Mai Ungwa's*) and family heads. The Emir and District heads, unlike other functionaries, do not exercise political power but serve as custodians of culture and advisers to the government on traditional affairs. They are quite influential in mobilizing people in their various emirates and districts. All the Emirs are first class title holders.

**Traditional Governance**: In terms of traditional administrative duties and with reference to the family lineage level, the family head presides over family meetings. During such meetings, family, land disputes and other minor disputes between family members are resolved. Above the family level is the ward head. If issues referred to him could not be resolved, such issues are referred to the village head. At the village level, the Village Head presides over meetings. Above the Village level, is the District Head and he exercises administrative and judicial authority over his district. Issues are referred to His Royal Highness the Emir from the court of the district heads. The Emir's council has authority to settle all forms of conflict. The economic base of the chieftaincy in the study area consists of tributes, gifts, fees, fines, compensations and money accruing from settlement of cases.

**Social Organization:** One of the most salient principles in Hausa society is the segregation of adults according to gender. Throughout Hausa land, seclusion of married women is normative, and the extra domestic impact of sexual segregation and stratification is that women are legal, political, and religious minors and the economic wards of men. Although women are central to kinship matters, they are excluded from extra domestic discussion and decision making. Both within the household and in the public domain, patriarchal authority is dominant and reinforced by spatial separation of the sexes.

The senior wife of the compound head, the *mai gida*, is the *uwar gida*. She may settle minor disputes among residents and give advice and aid to the younger women. Domestic authority rests with the male head of compound/household.

From childhood, males and females develop bond friendships with members of the same sex, a practice continued into adulthood and marked by reciprocal exchanges. Given their seclusion, women tend to formalize their bond ties more than men do. Formal relationships that emphasize differences in status (patron/client) are also established by women, as they are by men.

**Political Organization:** Organizational structure is hierarchic; the centralized kingdoms, known as emirates, are the primary groupings; districts are secondary and village areas tertiary. The institutions of kinship, client-ship, and office (and, in the past, slavery) in the emirates, have provided the fundamentals of Hausa government from the sixteenth century until the middle part of the twentieth century. Rank regulates relations between commoners and rulers.

"Traditional and modern government proceeds through a system of titled offices each of which is in theory a unique indissoluble legal corporation having definite rights, powers and duties, special relations to the throne and to certain other offices, special lands, farms, compounds, horses, praise songs, clients, and, formerly, slaves" (Smith 1965, 132). In most states, major offices are traditionally distributed among descent groups, so that rank and lineage intertwine. The traditional offices differed in rewards, power, and function, and were territorially based with attendant obligations and duties. Within communities, the various occupational groups distribute titles, which duplicate the ranks of the central political system.

Figure 5.32 highlights the leadership hierarchy system of the project Area. The Emir is the Paramount ruler followed by the District Head (Hakimi), Assisted by the Village Head (Miajimilla), who also supervises the Mai unguwa. There are other title holders such as Sarkin Noma (Chief Farmer), Sarkin Aska or Sarkin Wanzamai, Sarking Fulani (Leader of Fulani Pastoralist), etc. These are put in place to assist the Emir in managing administrative, cultural, and security issues among other of his function including conflict management and arbitration on local disputes between parties, groups or communities.

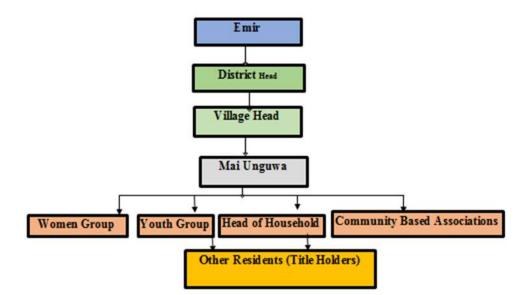

Figure 5.32: Traditional Leadership Hierarchy in the Study Area

Client-ship links men of unequal status, position, and wealth. It is a relationship of mutual benefit, whereby the client gains advice in his affairs at the minimum and protection, food, and shelter at the maximum. The patron can call upon the client to serve as his retainer.

In applying his notion of government to Kano, the Fulani religious and political leader Usman Dan Fodio, when he launched his successful jihad against the king of Gobir in 1804, he followed the basic premise of a theocracy within a legalistic framework; government, and its chief agent, the emir, were perceived as custodians of the Islamic faith.

**Social Control:** Legal affairs fall under the jurisdiction of the emir, and he is guided by Islamic law. The Quran, the word of Allah, and its hadith, the traditions of the Prophet Mohammed, along with the dictates of secular reasoning provide answers to legal questions. The Sharia, the canon law of Islam, is fundamentally a code of obligations, a guide to ethics. Sanctions of shame and ostracism compel conformity to Hausa and Islamic custom.

**Conflict Management:** When disputes arise, the Hausa man may opt to go to court, submit to mediation, or leave it to Allah. The basic process involves deference to mediation by elders.

#### 5.34 Public Health

Malaria has been a leading cause of morbidity and mortality in KYB, for many years, accounting for 79 per cent of the disease burden in KYB. Most parts of the country including the KY Basin have reported malaria transmission throughout the year, although it increases during and soon after the rainy season. Data and information collected as part of the Health Thematic Report indicate that diarrheal disease continues to be a major public health problem. It accounted for 16 % of the disease burden in last three years (since 2018). Cholera was the third major public health problem with 3 % of the disease burden in 2018. Lack of proper sanitation represents the greatest challenge to public health in the KY Basin. Increased food insecurity and malnutrition are also likely to decrease human disease resistance and human labour productivity and increase human deaths. The following factors will increase vulnerability to health and public safety problems:

- Lack of access to safe drinking water.
- Inadequate health services especially in areas which are far from main roads.
- Inadequate public awareness of disease risks associated with the use of water.

#### Health Facilities and prevalence diseases

There are primary Healthcare Clinics (PHC) in some of the surrounding communities. The PHCs are headed by Community Health Officer (In-Charge) with 5-7 staff each comprising of Community Health Assistants, Laboratory Assistant, one or two cleaners and at least two

security men working on shifts. The clinics need may need at least one well-trained Nurse since the PHCs are not served by resident doctors. The clinics are generally inaccessible for many communities.

Interactions during FGDs with various respondents the reveal the common diseases in the study area include malaria, typhoid, cholera, pneumonia, tetanus and injuries arising from use of traditional working tools especially farm implements, measles, dysentery/diarrhea etc. Other injuries from the use of farm and other associated implements, all other diseases are caused by environmental factors. Since access to portable clean water is a challenge in many of the communities the occurrence of environment-related diseases becomes obvious.

The FGD survey also revealed alternative sources of treatment of the various ailments to include visits to medicine stores and in severe cases visiting hospitals in the Local Government Headquarters. Essentially, visits to health centres and hospitals for treatment are always the last options due to high cost of treatment and long queues in general hospitals. Patent medicine stores and itinerant drug vendors are therefore popular medicare avenues and thus enjoy a lot of patronage especially on markets days.

However, the FGD also reveals that the cost of medical care generally affordable by most families induced by poverty are necessitated to partronise traditional herbs for treatment of simple diseases such as malaria, typhoid fever, cholera, high blood pressure and hyperglycemia (diabetes). Herbs used for such treatments include Neem Leaves; Paw Paw leaves and seeds; Moringa leaves seeds; the leaves and bark of guava leaves; as well as hibiscus flour etc.

#### **Causes of Morbidity and Deaths**

The main causes of death in Nigeria in 2019 were neonatal disorders. More specifically, 12.25 percent of all deaths were reported to have been due to neonatal disorders. Other common causes included malaria, diarrheal diseases, and lower respiratory infects. Figure 5.33 shows the distribution of frequency of morbidity and mortality in Nigeria based on causes. Most causes of deaths and morbidity are preventable.

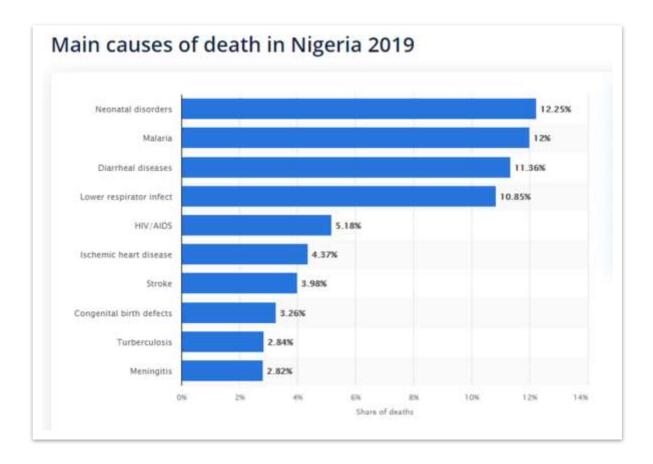

Figure 5.33: Main Causes of Deaths in Nigeria, 2019

Source: STATISTA. https://www.statista.com/statistics/1122916/main-causes-of-death-and-disability-in-nigeria/

Zubairu, Isa, and Auwal (2010) in a review of admission and deaths in Hospital in kano, Nigeria reported that adolescents age range 15-45 years had the highest number (57.9%) of admissions followed by 1-4 years (11.7%) and < 1 year (11.3%) age range. On the other hand, age range 15-45 years recorded the highest number (37.7%) of deaths followed by the 46–64 (23.8%) and the > 65 years (16.1%) category. However, the age range > 65 years recorded the highest number of deaths per admission giving rise to 16.5% mortality rate. The mortality rate increased as the age increased. Mortality rates for the years 2012, 2013, 2014, 2015, 2016 and 2017 were found to be 3.6%, 3.9%, 4.1%, 4.2%, 6.1% and 5.1% respectively.

| Disease diagnostic category (ICD-10 code)                        | Children (0-14 years) |       | Adult (≥15 years) |       | Total Adm. | Total death |
|--|-----------------------|-------|-------------------|-------|------------|-------------|

Figure 5.34: Causes of Mobidity by age groups in Kano State

Source: Zubairu, Isa, and Auwal (2010)

Zubairu, Isa, and Auwal (2010) also reported a mortality rate of 7.8% from hospital records in Kano State. Specifically, the report showed that of the 15,484 males admitted, 2,361 died giving a mortality rate of 15.2% while of the 36,491 females admitted, 1,668 died giving a mortality rate of 4.6%. The median age for all patients that died was 32.4 years, with 36.1 years for the male and 29.3 for the female subsets. The ten most common causes of mortality were HIV/AIDS (8.3%), Septicaemia (6.8%), cerebrovascular disease (6.3%), and chronic renal failure (3.9%) chronic liver disease (3.3%), diabetes mellitus (3.2), neonatal jaundice (2.9%), severe birth asphyxia (2.6%), prematurity (2.5%) and bronchopneumonia (2.4%). Thus, mortality rate and causes of death are comparable to similar centres within the state and in Nigeria. Regular mortality audits could identify management errors and prevent recurrence of avoidable deaths.

Zubairu Iliyasu, Isa Sadeeq Abubakar, and Auwal Umar Gajida (2010): Nigerian Journal of Medicine. Oct-Dec 2010; 19(4):400-6. doi: 10.4314/njm.v19i4.61964.

**Refuse Disposal System:** The most common refuse disposal system in the host community of the proposed project is through open burning within the community or compound of each household. These are later transported to farmlands and used as soil conditioner at the onset of farming season. About 75% of the respondents have disposal pits dug in their compounds while 25% disposes indiscriminately in unauthorized refuse dumps. The most common type of toilet facility in about 95% households in the study area is the traditional pit latrine (covered or uncovered) and about 5% still go to the bush.

*Household Assets:* The most commonly owned asset in the area is the farming bull and household items such as radio (76%); television set (69%), motorcycles (79%). A household cannot do without at least one motorcycle or bicycle as they are the most common means of transportation within the community.

#### 5.35 Security

The study area, like most communities in northern Nigeria, witnessed serious violent attacks from various terrorist groups and armed bandits between in the last ten years, where even the late Emir of Late Kano was attacked during Friday prayer. While it is difficult to estimate the number of serious security breaches that occurred in the area over the period, the episodes in neighboring Katsina to say the least is numerous ranging armed banditry, cattle rustling, kidnaping other forms of violent criminality. The Challawa Gorge Dam Watershed which traverses areas in Kano, Katsina and to a small extent Kaduna States, were banditry and terrorism cases have been reported can be said to be entirely free. For example, during public consultations, it was reported that areas of pilot sub-watershed 2 including Bari, Dutsen Kura and the neighborhoods of Palgore are areas to watch in terms of kidnaping and other forms of criminality.

Recently, the governor Kano State Government has shut down 10 boarding schools in the outskirts of the metropolis, due to the rising number of abductions of school children in neighbouring states. The government also announced other measures among which were the suspensions of sales of animals at markets in fourteen Local Government Areas of the state. And in the neighbouring Katsina State, the Governor reported that 10 out of the 34 Local Government Areas in the state were under severe attack daily by the bandits. While security breaches have become a common denominator in many northern states, it is hoped that the situation will continue to improve before commencement of this project.

#### 5.36 Consultations and Stakeholders Engagement and Perception

As a requirement and to be in line with international best practices, consultations were held at different levels and times using a participatory approach in this ESIA process. This is necessary to allow the concerned public/critical stakeholders to be part of the decision-making process towards the project development and operation. The process will also serve to ensure fulfillment of the community's expectations for a sustainable and environmentally friendly project development. Public participation in also deliver some beneficial information to the ESIA process that may enhance project benefits and minimizes any inadvertent but adverse outcomes of the project. Thus to make project development and operation transparent, public consultation is necessary, and continuous throughout the life of the project. Stakeholder consultations on the proposed project activities at the very early stage of decision-making may help to prevent or mitigate unexpected negative outcomes such as conflicts and adverse environmental impacts of the project decisions and to enhance the positive outcomes.

The project proponent, HJKYB-TF, the funding Agency (AfDB), the Federal Ministry of Environment and the Nigerian legal system regard consultation as a requirement for project development especially of the magnitude of a watershed. This is because it is Important to notify the stakeholders about the nature, magnitude, and scheduling of the proposed project, thereby eliminating any fears or apprehension.

Information dissemination and consultations with stakeholders, especially the Project Affected Persons (PAPs) means transfer of information from Project proponents to the affected population. It provides an opportunity for all the communities in the areas to raise issues and concerns pertaining to the project, and allow the identification of alternatives and recommendations.

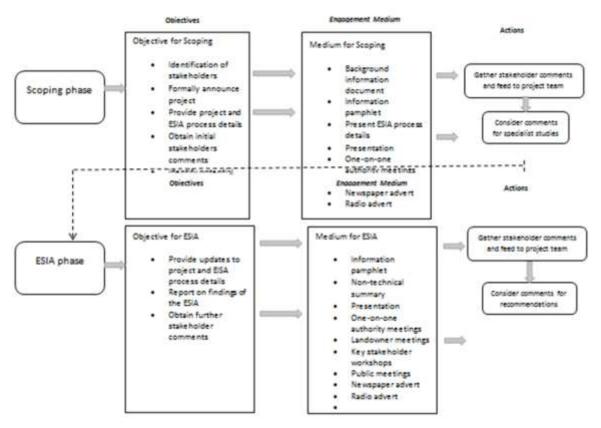

Specific objectives of the public consultations and information campaign include to:

- i. Fully share information about the ongoing project, its components and its activities with the affected people;
- ii. Obtain information about the needs of the affected people and their reactions towards the proposed activities;
- iii. Ensure transparency in all activities related to land acquisition and compensation payments;

- iv. To get the opinions of local residents especially the interested and affected parties about the problems anticipated with the project and how these can best be overcome.
- v. To ensure that stakeholder comments have been considered and addressed;
- vi. To draw on indigenous knowledge in the process of identifying environmental and social concerns associated with the proposed project, and to involve stakeholders in identifying ways in which these can be addressed;
- vii. To comply with the local legislative requirements;
- viii. To incorporate international best practices;
- ix. To satisfy AfDB requirements as contained in the its Operational Safeguards.

#### 5.36.1 Public Consultation Process

The consultation process ensured that all those identified as stakeholders were consulted. This started with the scoping exercise and includes Focus Group Discussions, meetings with community leaders, and community members in various locations of the project area as well as other concerned community members at separate times. Furthermore, especially with the PAPs One-to-one meeting was used during the survey of the socio-economic activities along the project corridors. The Stakeholder/Public Engagement process is summarised graphically in Figure 5.35; the same approach was used during the Scoping and ESIA phases.

#### 5.36.2 Discussion with Stakeholders and Summary of Outcome Conclusion

During the meetings, the general overview of the project was presented to the various stakeholders. In addition, the challenges emanating from the implementation of the project and the support needed from all parties to ensure effective project development and successful implementation were also presented and discussed. A key point mostly pointed out was the fact that the project was designed to benefit the government and the people especially those close to the project site and those downstream of the gorge dam. It was also clarified to the community members the benefits that may accrue to them from the implementation of the project such soil and gully stabilization leading to protection of their farm lands from river bank erosion and other forms of destructions arising from surface run off; introduction of exotic plant species especially the vertiver grass, fruits-bearing economic trees etc. It was also stressed that the proposed watershed management activity may create employment opportunities for the local community during the construction phase and facilitate for them innovative erosion control and management practices to enhance farm productivity and food security. Stakeholders emphasized the need to source for local workforce and labor from qualified personnel within the communities affected should the need arise.

| S/No. | Comments/Issues Raised by Public  | Responses  |
|-------|---|--|
| 1.    | thing to do and we appreciate that  | We are more than happy to assist as much as<br>we can. It is designed to improve and provide<br>support to affected areas and communities.<br>Thanks.  |
| 2.    | other places coming to do the work, we  | Part of this program is to employ able bodied<br>men and women and any other willing<br>individuals from within the local community<br>during the civil works. It gives a sense of<br>involvement and serves to benefit members of<br>that community. So, when there is a need to<br>employ contractors, you will be notified. |
| 3.    | completed or what happens to people<br>having their farms unused due to delay | Firstly, the project has been backed and given a<br>green light by the Federal Government of<br>Nigeria through the HJKYB-TF. The HJKYB-TF<br>has a good organizational structure to ensure<br>full and timely completion of the project. The<br>project has a well organised structure and set<br>timeline.                   |
|       |   | The AfDB as the funding body has rules and guidelines to ensure project completion and on schedule   |
|       | Can we go back to use our lands for<br>raising crops?                         | Further backing is being provided by the African<br>Development Bank. Every project aspect will<br>be set according to the Nigerian regulations<br>and standards. However, it may not be feasible<br>to allow people take back and cultivated their<br>lands after they must have been compensated<br>or settled.              |
| 4.    |   | Such persons might not be directly considered.<br>But there is an inbuilt mechanism to involve   |

 Table 5.29: Queries/Observation and the response given by the Stakeholders

|    | by the gully erosion?                 | farmers on erosion control and its management      |
|----|---------------------------------------|--|
|    |                                       | on their farms through extension support. There    |
|    |                                       | is a component of the project for on-farm bio-     |
|    |                                       | remediation using beneficial agricultural          |
|    |                                       | techniques such as planting of grasses, mixed      |
|    |                                       | cropping of vegetables, contour ploughing etc,     |
|    |                                       | that the farmers will be assisted to practice on   |
|    |                                       | their farms. In any case they will have            |
|    |                                       | substantial project benefits.                      |
| 5. | How about including our Village Heads | Of course, Village Heads and community heads       |
|    | and Community Leaders?                | have a vital role to play in project developments  |
|    |                                       | by assisting the Project implementation Unit in    |
|    |                                       | the area of security, Hiring of trusted labour     |
|    |                                       | force, identification of PAPs in times of          |
|    |                                       | Compensation etc.                                  |
|    |                                       | Involving them will boost trust and a sense of     |
|    |                                       | commitment in the project.                         |
| 6. | How soon will the project start?      | As stated earlier the project has been             |
|    |                                       | designed to follow due process and timelines.      |
|    |                                       | This is very important when discussion on start    |
|    |                                       | date for the project. The HJKYB-TF is fully of     |
|    |                                       | commencing project activities as soon as all due   |
|    |                                       | processes are fully met.                           |
| 7. | Will persons without legal property   | Yes. Preference for land-for-land compensation,    |
|    |                                       | land of equal or equivalent value. If not, cash at |
|    |                                       | full replacement value, including transfer costs   |
|    | resettlement plan?                    | will be paid to the verified project affected      |
|    |                                       | persons.   |
| 8. |                                       | The project is targeting planting more economic    |
|    |                                       | trees both exotic and local species. These         |
|    | all the years past?                   | include Avocado, Orange, and other                 |
|    |                                       | economically beneficial trees. Trees in the        |
|    |                                       | project area will be preserved as much as          |
|    |                                       | possible while new ones will be planted.           |

| 9. | Shall we be allowed to graze ou   | Not likely since the idea is to keep the planted |
|----|-----------------------------------|--|
|    | livestock on the planted grasses? | grasses alive and. However there will still be   |
|    |                                   | enough space for animals grazing outside the     |
|    |                                   | project corridor.                                |

The concerns and issues that raised by the stakeholder during public and stakeholder consultations are not exhaustive. Consultation is a continuous process and therefore shall be sustained throughout the lifecycle of the Challawa Gorge Dam Project Development and Management.

# CHAPTER SIX MITIGATION/ENHANCEMENT MEASURES

#### 6.14 Introduction

This chapter identifies and presents the impacts mitigation and enhancement measures arising from the ESIA outlined in the previous chapters. The mitigation measures are guides on what is required to avoid/minimize the likely negative environmental, social and economic undesirable consequences of the project implementation and how to enhance the positive impacts.

The ESIA is an instrument used to identify, predict and assess the likely environmental, climate change and social consequences of a proposed development project in order to ascertain the means through which to avoid, minimize, mitigate, compensate/offset and/or monitor adverse impacts, and increase development benefits. This ESIA therefore assesses the direct, indirect and cumulative impacts of the Challawa Gorge Dam Watershed Management Project in its area of influence; examines project alternatives; and determines the significance of each of the impacts identified. The ESIA identifies ways of improving project selection, design, siting and implementation in order to avoid or mitigate and manage adverse environmental and social impacts that may arise from the project activities.

The broad approach (and methods) adopted for assessing the impacts of the proposed Challawa Gorge Dam Watershed Management project on the physical, biological and social environments is hinged on the Federal Ministry of Environment ESIA Guidelines and the AfDB guidelines contained the AfDB's revised operational safeguards and sustainability series, Volume 1 - Issue 4 (November 2015). Furthermore, the primary information obtained during field data gathering in the project area (including information gathered from members of affected communities and other stakeholders during consultations), secondary information from existing relevant literatures as well as professional experience and judgments of the multidisciplinary ESIA team formed the bedrock upon which the potential impacts were identified and evaluated. In line with the above, impact assessment was carried out in stages as follows:

• Impact Prediction: this entails prediction of changes to the environment that could result from the proposed watershed management project.

- The prediction of these changes will be based on the identification of potential interactions between the project and the physical, biological and social resources/receptors.
- Impact Characterization: which entails characterizing/forecasting the nature, scale, extent, duration, frequency of the impacts. Characterization will essentially help to determine the magnitude of impacts and degree of change the impact is likely to have on the receptor.
- Impact Evaluation: this entails determination of the significance of impacts based on the magnitude, value, sensitivity/fragility and recoverability of the affected receptors. This requires an in-depth appraisal of the attributes of potential receptors which has been carried out in the baseline studies and presented in Chapter 5 of this report.

The Chapter also presents the approach adopted for the mitigation of identified impacts and outlines the approach for predicting any residual consequences after the application of mitigation measures. The short-term (preconstruction, construction and decommissioning phases) and the long-term (operational phase) were considered. Provision of the assessment methodology used in evaluating impact significance, considering the impact magnitude and sensitivity of receptors and resources affected, is also outlined.

As part of the impact assessment process, the primary Project activities (source of potential impacts) considered, and the environmental and social aspects and receptors assessed for possible effects during the construction and operational phases of the development are presented in Table 6.1.

| Aspect     | Phases       | Activities  |  |
|------------|--------------|---|--|
| Indicative | Pre-         | Consultation with Project Affected Persons,                   |  |
| project    | Construction | Construction site clearance,                                  |  |
| activities | Phase        | Establishment of nurseries for raising seedlings              |  |
|            |              | Transportation of materials and men                           |  |
|            | Construction | Establishment of a construction yard;                         |  |
|            | Phase        | Mobilisation of machineries and equipment for construction;   |  |
|            |              | Use of natural resources (water, energy sources);             |  |
|            |              | Disposal of waste generated from construction activities, and |  |
|            |              | Non-routine events (e.g. spills, traffic, accidents,          |  |

| Aspect         | Phases       | Activities  |  |  |
|----------------|--------------|---|--|--|
|                |              | occupational health & safety incidents).                  |  |  |
|                | Operation    | Stabilization of planted trees, shrubs and grasses        |  |  |
|                | Phase        | surrounding the dam and buffer strips along different     |  |  |
|                |              | tributary gullies and finger gullies;                     |  |  |
|                |              | Construction of check dams and other erosion regulation   |  |  |
|                |              | structures;   |  |  |
|                |              | Regular maintenance of the trees, shrubs and grasses till |  |  |
|                |              | maturity;   |  |  |
| Environmental  | Construction | Biophysical Environment:                                  |  |  |
| indicators, or | and          | Air quality;  |  |  |
| resources      | Operations   | Noise;  |  |  |
| receptors      |              | Soils;  |  |  |
| considered in  |              | Surface Water;  |  |  |
| the impact     |              | Vegetal Resources   |  |  |
| assessment     |              | Wildlife Resources  |  |  |
|                |              | Fisheries and aquatic Resources.                          |  |  |
|                |              |   |  |  |
|                |              | Human Environment   |  |  |
|                |              | Water borne diseases;                                     |  |  |
|                |              | Resettlement Issues;                                      |  |  |
|                |              | Effects on transportation                                 |  |  |
|                |              | Effect on health pattern;                                 |  |  |

For each environmental component, the associated potential impacts of Project activities are identified and the significance of the effects assessed. A summary table of all potential impacts with their significance is presented in Tables below:

## 6.15 Impact Assessment Approach and Methods

This section describes the overall approach used for the assessment of impacts. Topic-specific methodologies are described under each section of the impact assessment. The assessment of impacts follows an interactive process involving the following key elements:

- Prediction of potential impacts and their magnitude (i.e., the consequences of the proposed on the natural and social environment);
- Evaluation of the significance of impacts taking into consideration the sensitivity of the environmental resources or human receptors into account;

- Develop mitigation measures to avoid, reduce or manage the impacts or enhancement measures to increase positive impacts; and assess significant residual impacts after applying mitigation and enhancement measures.
- Where significant residual impacts remain, further options for mitigation may be considered and impacts re-assessed until they are as low as reasonably practicable for the Project.

A graphical overview of the impact prediction and assessment procedure adopted is presented in Figure 6.1.

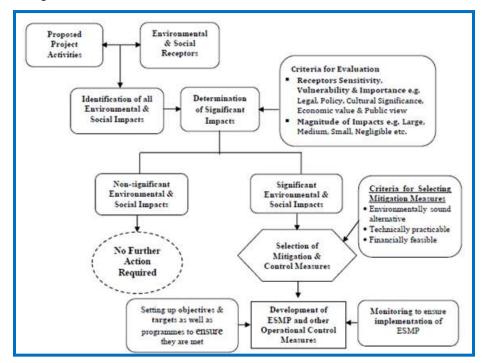

Figure 6.1: Impact Prediction and Assessment Procedure

# 6.16 Definition of Impact Terminologies

## Nature/Type of impacts

There are several ways that impacts may be described and quantified. Table 6.2 provides definitions of terms used in this section.

# Table 6.2: Definition of Impacts

| 1 | NATURE OF IMPACT: An impact is essentially any change to a resource or receptor           |
|---|---|
|   | brought about by the presence of a project component or by the execution of a project     |
|   | related activity.   |
|   | Negative - an impact that represents an adverse change from the baseline or               |
|   | introduces a new undesirable factor.  |
|   | Positive - an impact that represents an improvement to the baseline or introduces a       |
|   | new desirable factor.   |
| 2 | TYPE OF IMPACT:   |
|   | • Direct (or primary) – impacts that result from the direct interaction between planned   |
|   | project activity and the receiving environment  |
|   | • Secondary - impacts that result from the primary interaction between the Project        |
|   | and its environment because of subsequent interactions within the environment.            |
|   | • Indirect - impacts that result from other activities that are encouraged to happen      |
|   | because of the Project.   |
| 3 | TEMPORAL SCALE OF IMPACT:   |
|   | • Temporary - impacts are predicted to be of short duration, reversible and               |
|   | intermittent/occasional. The receptor will return to a previous state when the impact     |
|   | ceases or after a period of recovery.   |
|   | • Short-term - impacts that are predicted to last only for a limited period (i.e., during |
|   | construction) but will cease on completion of the activity or because of mitigation       |
|   | measures and natural recovery (e.g., non-local construction workforce-local               |
|   | community interactions).  |
|   | • Long-term - Impacts that will continue for the project's life but cease when the        |
|   | project stops operating (i.e. 50years or when there is improvement in technology          |
|   | that requires replacement). These will include impacts that may be intermittent or        |
|   | repeated rather than continuous if they occur over an extended period.                    |
| 4 | SPATIAL SCALE OF IMPACT:  |
|   | Onsite – impacts that are limited to the Project site.                                    |
|   | • Local - impacts that affect locally significant environmental resources or are          |
|   | restricted to a single (local) administrative area or a single community. For this        |
|   | ESIA, local impacts are limited to the Project site and its zone of influence.            |
|   | • Regional - impacts that affect regionally significant environmental resources or are    |
|   | experienced at a regional scale as determined by administrative boundaries.               |
|   | • National - impacts that affect nationally significant environmental resources; affect   |
|   | an area that is nationally important /protected, or have macro-economic                   |

consequences (i.e. Nigeria).

- International impacts that affect internationally essential resources such as areas protected by International Conventions.
- Trans-boundary impacts that are experienced in one country as a result of activities in another.

## 6.17 Magnitude of Impact

The term 'magnitude' covers all the dimensions of the predicted impact on the natural and social environment, including:

- The nature of the change (what resource or receptor is affected and how);
- The spatial extent of the area impacted, or proportion of the population or community affected;
- Its temporal extent (i.e. duration, frequency, reversibility); and where relevant (accidental or unplanned events), the probability of the impact occurring.

Table 6.2 provides the definitions for the spatial and temporal dimensions of the magnitude of impacts used in this assessment for biophysical impacts.

For social impacts, the magnitude considers the perspective of those affected by taking into account the likely perceived importance of the impact, the ability of people to manage and adapt to change and the extent to which a human receptor gains or losses access to or control over socio-economic resources (1) resulting in a positive or negative effect on their well-being (a concept combining an individual's health, prosperity, their quality of life, and their satisfaction).

#### 6.18 Sensitivity of Resources and Receptors

Sensitivities are defined as aspects of the natural or social environment that support and sustain people and nature. Once affected, their disruption could lead to a disturbance of the stability or the integrity of that environment. For ecological impacts, sensitivity can be assigned as low, medium or high based on the conservation importance of habitats and species. For habitats, these are based on naturalness, extent, rarity, fragility, diversity and importance as a community resource.

For socio-economic impacts, the degree of sensitivity of a receptor is defined as a stakeholder's (or groups of stakeholders') resilience or capacity to cope with sudden changes or economic shocks'. The sensitivity of a resource is based on its quality and value/importance, for example, by its local, regional, national or international designation, its importance to the local or broader community, or its economic value.

## 6.19 Likelihood

Terms used to define the likelihood of occurrence of an impact are explained in Table 6.3.

| Definition of likelihood |                                |                                 |  |  |
|--------------------------|--------------------------------|---------------------------------|--|--|
| High probability         | Refers to a very likely impact | Refers to very frequent impacts |  |  |
| Medium probability       | Refers to a potential impact   | Refers to occasional impacts    |  |  |
| Low probability          | Refers to an improbable impact | Refers to rare impacts          |  |  |

Table 6.3: Explanation of Terms Used for the Likelihood of Occurrence

# 6.20 Impact Evaluation

The third stage in the assessment procedure involved the evaluation of the impacts identified to determine their significance. This was based on the methodological framework set by (ISO) 14001 – EMS and EMSP Aspects and Impacts – Determining Significance developed by the University of Bristol in 2015. The evaluation of impact significance was based on the following clearly defined criteria:

- Environmental Legislation and Policy
- Stakeholders' Concern and Interest
- The severity of Environmental and Social Impacts
- Magnitude/Scale of Impacts
- Frequency of Occurrence of Impacts

The above criteria and the rating adopted for the evaluation are described in Table 6.4.

| Aspect             | Phases         | Activities   |  |
|--------------------|----------------|--|--|
| Indicative         | Pre-           | Consultation with PAPs,                                  |  |
| project activities | Construction   | Vegetation clearance,                                    |  |
|                    | Phase          | Transportation of men & materials                        |  |
|                    | Construction   | Transportation of men & construction materials,          |  |
|                    | Phase          | Establishment of a construction yard;                    |  |
|                    | Thase          | Preparation of building foundations;                     |  |
|                    |                | Assembly of machinery and equipment for construction;    |  |
|                    |                | Use of natural resources (water, energy sources);        |  |
|                    |                | Disposal of waste materials from construction activities |  |
|                    |                | and wastewater; and                                      |  |

## 6.21 Overall Significance Ranking

## **Overall Significance Ranking**

The identified environmental and social impacts are evaluated, categorized and scored according to the criteria defined in Tables 6.1; 6.4. Overall consequence of the project is finally determined using the consequence equation and the criteria in table 6.6.

Project Consequence (Overall Impact Significance) = [(A + B + C + D)] **X** Likelihood (Z) = Significance evaluation score

## Table 6.6: Significance Level Categories

| Impact Significance          | Score   |
|------------------------------|---------|
| Low Negative Significance    | 1 – 25  |
| Medium Negative Significance | 26 – 50 |
| High Negative Significance   | > 50    |
| Positive Significance        | < -1    |
| 100 1000                     | '       |

ISO, 1996

## 6.9 Approach to mitigation measures

The approach adopted this report for identifying mitigation measures and their significance are based on the following considerations:

- Environmental laws and regulations in Nigeria, with emphasis on permissible limits for waste streams (FMEnv (formerly FEPA), 1991);
- AfDB's and other relevant international requirements;
- Best available Technology for Sustainable Development;
- Feasibility of application of the proposed mitigation measures in Nigeria;
- View and concerns of stakeholders as expressed during extensive consultations carried out during the study.

The essence of developing mitigation measures is to avoid, reduce, remedy or compensate for any adverse impacts identified, and to create or enhance positive impacts including environmental and social benefits. In this regard therefore, mitigation measures are understood to include operational controls as well as management actions. These measures may include:

- changes to the design of the project during the design process (e.g. changing the development approach);
- engineering controls and other physical measures applied (e.g. substation maintenance facilities);
- Operational plans and procedures (e.g. Occupational Health Safety Plans); and the provision of like-for-like replacement, restoration or compensation.

For any impact that is major significance, a change in design, layout or concept is usually required to avoid or minimize it. Impacts evaluated as moderate in importance, specific mitigation measures such as engineering controls or other alternatives may be needed to reduce the impacts to as low as reasonably possible levels.

In this case the approach also takes into consideration the technical and financial feasibility of the mitigation measures. Impacts assessed to be of Minor significance are usually managed through best engineering and technical practices and operational procedures. While negligible impacts may require no mitigation action, nonetheless they are usually included in the project design. Mitigation measures are proposed by focusing on such measures that can prevent or minimize undesirable impacts through the design and management of the project.

## 6.10 Residual Impact Assessment

Impact prediction considers any mitigation, control and operational management measures that are part of the project design and project plan. A residual impact is predicted to remain once mitigation measures have been designed into the intended activity. The residual effects that may remain after applying the impact mitigation measures have also been discussed for further reduction as possible.

## 6.11 Potential Impacts during Initial Preconstruction Phase

## 6.11.1 Impacts on Air Quality

The assessment of potential impacts on air quality, sources, rating criteria and mitigation measures are presented in Table 6.7.

| Impact          | Sources of      | Mitigation Measures      | Impact on Ambient Air Quality |  |
|-----------------|-----------------|--------------------------|-------------------------------|--|
| Statement       | Impact          | Integrated into Project  |                               |  |

|  | equipment.          | engines.                |                               |  |  |  |
| Mitigation meas  | Mitigation measures |                         |                               |  |  |  |
| Vehicles transporting men and materials will generate PM, SO2, CO, NO2, CO2 emissions. This      |                     |                         |                               |  |  |  |
| Activity is expected to add to baseline concentrations. This impact is rated minor, and the      |                     |                         |                               |  |  |  |
| implementation of the mitigation measures would drastically reduce the effect to barest minimum. |                     |                         |                               |  |  |  |
| Residual Impact  |                     |                         |                               |  |  |  |
| Minor (Overall   | Rating = 18)        |                         |                               |  |  |  |

Vehicles transporting men and materials will generate PM, SO<sub>2</sub>, CO, NO<sub>2</sub>, CO<sub>2</sub> emissions. This activity is expected to add to baseline concentrations. This impact is rated minor, and the implementation of the mitigation measures in Table 6.6 will reduce the effect to a minor level. B: Vegetal removal during site clearance may contribute to global warming as a sink for carbon sequestration will be lost. However, this activity is in the short term as there will be vegetation replacement during construction in the form of economy of trees, vertiver grass and shrubs for soil and gully banks stabilization. It is therefore expected that the environmental quality will be restored over a long term. This impact is rated **minor** and the implementation of the mitigation measures will reduce the impact to normal level.

## 6.11.2 Impacts on Ambient Noise Level

The assessment of the potential impact on noise, sources, rating criteria and mitigation measures are presented in Table 6.8.

| Table 6.8: Assessment of Impacts and | Mitigation | Measures | on | Ambient | Noise | Impact |
|--------------------------------------|------------|----------|----|---------|-------|--------|
| During Initial Preconstruction Phase |            |          |    |         |       |        |

| Impact          | Sources of         | Mitigation Measures       | Impact on Noise          |                  |  |
|-----------------|--------------------|---------------------------|--------------------------|------------------|--|

| movement and v  | work activities to | day-time only.            |                          |                  |  |
| Residual Impac  | ct                 |                           |                          |                  |  |
| Minor           |                    |                           |                          |                  |  |

The baseline noise levels were normal within the regulatory limits for schools, residential areas and faith centres; the project may however add to the baseline noise level during this phase and the impact is rated Minor. However, implementing the mitigation measures shall reduce the impact to near normal level.

## 6.11.3 Impacts on Soil

The summary of the potential impact on soil sources, rating criteria and mitigation measures are presented in Table 6.9.

| Impact Sources of Mitigation Measures Impact on Soil and geology |                    |                               |                                     |  |  |  |  |

## Table 6.9: Soil and Geology Impacts during Preconstruction Phase

## **Impact Description**

Land clearing, transportation of materials to the site shall likely cause a change in the soil structure, making it more compacted. Clearing of vegetation will also expose the soil to further water erosion. This impact is rated Minor, but the mitigation measures would significantly address the problem and the impact would restore to near normal.

## 6.11.4 Impacts on Surface and Groundwater

The potential impact on water resources, sources, rating criteria and mitigation measures are presented in Table 6.10.

| Impact  | Sources of Impact          | Mitigation Measures      | Impact on surface and ground |  |  |  |  |

|                            | paolo on Malor | Resources during        | i i coonsti uotion i nasc |

Impact Description

Minor (Overall Impact Rating = 32)

Baseline surface water and turbidity levels were within regulatory limits. The project activities will produce overburden which may be washed down by rain into nearby water bodies. This shall add to the baseline turbidity level, which is currently within WHO regulatory limits.

Depending on the spill's magnitude, a vast accidental spill may seep into the ground water and contaminate the water source. This shall lead to groundwater pollution; thus, rendering these waters unsafe for drinking. Vegetation clearing will increase the runoff rate into the river, adding

to the present turbidity levels. Also, runoff may accidentally deposit spilt oil during machine/equipment repair and maintenance into the natural watercourses. This shall further influence the baseline surface water DO levels below the regulatory limits at project foot-prints, although the scale may be very low. The overall impact significance is Minor.

## 6.11.5 Impact on Vegetation

The potential impact on vegetation sources, rating criteria and mitigation measures are presented in Table 6.11.

| Impact   | Sources of Impact      | Mitigation Measures     | Impact on vegetation resources |  |  |  |
|--|------------------------|-------------------------|--------------------------------|--|--|--|

| Adequate measures should be taken to ensure minimal vegetation losses and re-planting of both exotic |                        |                         |                                |  |  |  |

#### Table 6.11: Impacts on Water Resources during Preconstruction Phase

Adequate measures should be taken to ensure minimal vegetation losses and re-planting of both exotic and economic vegetation species around the site Land clearing and site grading should be well planned to avoid excessive vegetation loss.

#### **Residual Impact**

## Minor )Overall Impact Rating = 28)

Almost all the vegetal resources in the study area were reviewed to offer Provisioning Services. However, considering the relative amount of vegetal quantity that would be cleared and the sensitivity of the habitats and the threatened plant species, implementing the mitigation measures listed shall reduce these impacts to a negligible significance

## 6.11.6 Impacts on Wildlife

The potential impact on wildlife sources, rating criteria and mitigation measures are presented in Table 6.12.

| Impact Statement   | Sources of Impact          | Mitigation Measures         | Impact on wildlife       |              |  |  |

## Impact description

Vegetation shall be cleared during this project. This will lead to species migration, loss of habitat and loss of threatened flora species in the area. The mitigation measures proffered would reduce the impact to minor level.

## 6.11.7 Impact on Fisheries and Aquatic Resources

The potential impact on fish and other aquatic resources, rating criteria and mitigation measures are presented in Table 6.13.

#### **Impact Statement** Sources of Impact Mitigation Measures Impact on fisheries and aquatic Integrated into resources Project Design Poisoning of Fisheries Excessive application Establishment of Impact criteria Rating Aquatic agro-chemicals plants nursery for bioand of Legislature 2 Resources remediation and fertilizer in plant Stakeholder concern and 1 nurseries around the buffer strip should be Severity 1 dam can affect fish establish some Scale 2 production. distance away from frequency 5 the river systems. **Overall rating** 25 Proper application of Impact Significance Moderate required fertilizer to seedlings. Mitigation measures Establishment of vertiver grass and other tree seedlings nursery for bio-remediation and buffer stripping should be located some distance away from the river banks and main and finger gully banks. Proper

## Table: 6.13 Impacts on Fisheries and Aquatic Resources.

Establishment of vertiver grass and other tree seedlings nursery for bio-remediation and buffer stripping should be located some distance away from the river banks and main and finger gully banks. Proper application of required fertilizer and other agrochemical on for raising grasses, shrubs and trees seedlings should be done in accordance with scientifically acceptable practices to minimize likelihood of surface runoff transporting unwanted chemical residues in to water bodies and contaminate the water.

**Residual Impact** 

Minor (overall Impact Rating = 25)

## **Impact Description**

Excessive application of agro-chemicals and fertilizers on plant nurseries and subsequently on project footprints may lead to chemical pollution of both surface and ground water through runoff and seepage especially around the Dam. This has the potential to affect fish resource over time as quantity of chemicals in the water grows.

## 6.11.8 Impacts on Socio-cultural resources

The potential impact on socio-cultural resources, sources, rating criteria are presented in Table 6.14.

| Impact Statement         | Sources of Impact           | Mitigation Measures        | Impact on Community Socio-           |

# Table 6.14: Impacts on socio-cultural resources

#### **Impact Description**

Although there are no known historical, cultural or archaeological sites within the project site, land acquisition may infringe on lands in dispute of ownership and inheritance. Implementation of on-farm agricultural techniques for erosion control and acquisition of lands for other project activities may, if care is not taken, infringe on fields/farms that are liable to inherence disputes among families. Where this happens, it may have the potential to heightening tension and conflict among disputing family members on the use of the land.

## 6.12 Socio-economic Mitigation Measures

## 6.12.1 Impacts on Demography/Population

The potential impact of the project on population, demographic characteristics of the project area and the possible mitigation measure are presented in table 6.15.

| Impact Statement    | Sources of Impact         | Mitigation Measures         | Impact on Demography and |  |  |  |  |  |
|---------------------|---------------------------|-----------------------------|--------------------------|--|--|--|--|--|
|                     |                           | Integrated into Project     | Population               |  |  |  |  |  |
|                     |                           | Design                      |                          |  |  |  |  |  |
|                     |                           |                             |                          |  |  |  |  |  |

| Mitigation measures | Mitigation measures       |                             |                          |  |  |  |  |  |

## Table: 6.15 Impacts on Demography/Population.

The contractor will however, mitigate this impact by localizing employment opportunities as much as possible and in consultation with community heads. Contractor shall propose to provide employment to locals at all phases of development of the project and throughout its lifetime. Additionally, certain jobs will be subcontracted out to local businesses.

## **Residual Impact**

Minor (Overall rating = 45)

## **Description of the Project Impact**

Identifiable negative impacts relate to increase in population of non-residents in the event that youths and local people are not recruited into the labour force during construction. There is also the likelihood of gender imbalance. It is expected that the proposed mitigation measures will ensure minimal impact and enhance the positive effects of the project.

## 6.12.2 Impacts on Income/Livelihood

The potential impact on income and livelihood sources, rating criteria and mitigation measures are presented in Tables 6.16.

| Impact         | Sources of                    | Enhancement Measures   | Impacts on               |
|----------------|-------------------------------|--|--------------------------|
| Statement      | Impact                        | Integrated into Project Design   | Income/Livelihood        |
|                |                               |  |                          |
| Income/Livelih | Loss of                       | The potential impact on the  | Impact criteria Rating   |
| ood            | farmlands and                 | incomes and livelihoods of   | Legislature 3            |
|                | other livelihood<br>structure | potentially affected persons<br>through loss of farmlands and loss<br>of structures will be adequately | Stakeholder 3<br>concern |
|                |                               | mitigated with appropriate compensation plan and   | Severity 3               |
|                |                               | adjustment measures for affected   | Scale 2                  |
|                |                               | persons.   | Frequency 5              |
|                |                               |  | Overall rating 55        |
|                |                               |  | Impact High              |
|                |                               |  | Significance negative    |

## Table: 6.16 Income/Livelihood

#### Enhancement measures

The potential impact on the incomes and livelihoods of potentially affected persons (PAPs) through loss of farmlands and loss of structures will be adequately mitigated with appropriate compensation plan and adjustment measures for affected persons.

## **Residual Impact**

High Negative (overall impact rating = 55)

## **Description of Impact**

Loss of farmlands and other livelihood structures may ensure arising from land acquisition for Bio-remediation and related project activities. Although no direct residential area relocation is anticipated from the project, it is highly possible that farmlands will be affected especially near the footprints of the project i.e. around the reservoir, and around main and finger gullies. Measure recommended will therefore minimize to the minimum the undesirable effects of the project that may affect PAPs.

## 6.12.3 Impacts on Employment and Opportunities

The potential impact on livelihood activities, sources, rating criteria and mitigation measures are presented in Tables 6.17.

| Im  | pact             | Sources of       | Enhancement Measures                | Impact on the impact on |

|  |  |                                     |              |          |  |  |

**Residual Impact (Positive Impact)** 

**Beneficial Positive** 

## **Description of Impact**

It is expected that casual un-skilled labour would be engaged on short-term occur for or throughout the preconstruction phase. The main jobs that will be available are the vegetal clearance, sales and requirement of materials. Supplies will include raw materials that meet standards as required for the construction of the facilities. This is a positive impact and, as such, does not require mitigation. The enhancement measures are stipulated in Table 6.18.

## 6.12.4 Impact of Community Infrastructure

The potential impact on community Infrastructure, sources, rating criteria and mitigation measures are presented in Tables 6.18.

| Impact         | Sources of   | Enhancement Measures              | Impact on         | Community  |  |  |  |

## Table: 6.18 Community Infrastructure

Minor (overall impact rating = 20)

## **Description of Impact**

Interference with community infrastructure during construction activities are likely to happen. This will include interference with health infrastructure, water supply infrastructure, transport infrastructure etc. The mitigation measures suggested in Table 6.19 will minimize the impact which in any way is minor.

## 6.13 Impact and Mitigation Measures During Construction Phase

## 6.13.1 Impacts on Ambient Air Quality

The potential impact on Ambient Air Quality, sources, rating criteria and mitigation measures are presented in Table 6.20.

| Impact Statement    | Sources of<br>Impact | Project Design                              | Impact on <i>A</i> air quality |        |

|--|-------------|------------|---------|-----|---------|
|--|-------------|------------|---------|-----|---------|

Water shall be sprinkled on roads and other conveying routes and stockpiles to suppress dust. These emissions are short-termed and localized to the immediate site area. Regular maintenance of vehicle and construction equipment (regular emission control and inspection) shall be ensured to greatly reduce mission from internal combustion engines.

Residual Impact

|-------------------------------|----------------------|---------------------------|------------------|------------|------|--------------------|--|---------|
| Moderate (Impact Rating = 45) |                      |                           |                  |            |      |                    |  |         |

## Impact Description

The main potential sources of emission are fugitive dust produced by the movement of soils during site clearing, grading and filling, and emission from internal combustion engines of construction equipment. The vehicle movement for the construction will result in PM, SO<sub>2</sub>, CO, NOx<sub>2</sub>CO<sub>2</sub> emissions. However, this may be minimal in view the fact that few vehicles are expected to be deployed at any time.

#### 6.13.2 Impacts on Ambient Noise Level

The potential impact on Ambient Noise Level, sources, rating criteria and mitigation measures are presented in Table 6.20.

| Impact   | Sources of Impact  | Mitigation Measures Integrated     | Impact on Amb   | pient noise |  |  |

| Mitigation measures  |                    |                                    |                 |             |  |  |
| All noise generating equipment shall be fitted with noise control as well as vibration devices, and  |                    |                                    |                 |             |  |  |
| properly maintained. Noise level shall be regularly monitored and accordingly adjusted. Construction |                    |                                    |                 |             |  |  |

#### Table 6.20: Impacts on Ambient Noise Level

activities shall take place in the day time.

**Residual Impact** 

Moderate (Overall rating = 45)

#### **Description of Impact**

During the construction phase, construction activities, traffic, and the use of construction equipment and machinery are likely to lead to a temporary increase in noise levels that may disturb adjoining areas and local fauna. Construction activities will be concentrated and done sequentially so that no area is prone to the long duration of noise impacts. There will be some noise generated from tractors and trucks transporting the materials and equipment, but traffic volumes are occasionally expected. Recommended mitigation measures shall lead to minimal noise pollution to an unnoticeable level.

## 6.13.3 Impacts on Soil

The potential impact on Soil, sources, rating criteria and mitigation measures are presented in Table 6.21

| Impact Statement   | Sources of<br>Impact | MitigationMeasuresIntegratedintoProjectDesign | Impact on Soil    |  |  |  |

## Table 6.21: Impacts on Soil

## **Impact Description**

Soil can be contaminated during the construction phase by accidental oil/fuel spills from heavy machinery either at storage yards or work sites. In the event of an accidental spill, the proportion of soil contamination will depend on the magnitude of these unintentional events.

## 6.13.4 Impacts on Water Resources

The potential impact on Water Resources, sources, rating criteria and mitigation measures are presented in Table 6.22.

| Impact Statement   | Sources of      | Mitigation Measures Integrated into Project    | Impact on      | Water  |

| management shall   | be ensured.   | Con    | tractor shall ensure that litters, fuels and solv | ents do not   | enter nearby  |  |
| streams and storm water drains. Gully floors and gully banks disturbance shall take place in the dry season to |               |        |   |               |               |  |
| minimize sediment influx and to allow time for disturbed gully floors banks to settle adequately before the    |               |        |   |               |               |  |
| resumption of rains.   |               |        |   |               |               |  |
| Residual Impact  |               |        |   |               |               |  |

Moderate (Overall rating = 45)

Sources of impact on water resources include removing vegetation, vehicle movement, and contamination from potential spills. Vegetal clearance can increase soil erosion, causing sediment influx into water bodies, especially during rain events. This shall likely add to the baseline surface water with turbidity levels already above threshold limits. Poor waste management practices are likely to affect water quality (e.g. improper waste disposal in the stream). The risk of accidental oil spills from heavy machinery during the construction phase could result in water contamination.

#### 6.13.5 Impacts on Vegetation

The potential impact on vegetation, sources, rating criteria and mitigation measures are presented in Table 6.23.

| Impact Statement | Sources of         | Recommendation Measures          | Impact on V     | egetation  |
|------------------|--------------------|----------------------------------|-----------------|------------|
|                  | Impact             | Integrated into Project          | during cor      | nstruction |
|                  |                    | Design                           | Phase           |            |

| During construction,  | a buffer of natural ve | getation at the site boundary shal  | II be maintained to | o serve as |  |  |
| shelter belt and or wind break and further provide a milder microenvironment for the project site. Strict   |                        |                                     |                     |            |  |  |
| control on site clearing activities shall be implemented to minimize loss of vegetation and clearance shall |                        |                                     |                     |            |  |  |
| be strictly limited to ta   | arget vegetation.      |                                     |                     |            |  |  |
|   |                        |                                     |                     |            |  |  |

## **Residual Impact**

## Moderate (Impact Rating = 45)

Movement of construction equipment and workers shall be restricted to the construction site. During construction, a buffer of natural vegetation at the site boundary shall be maintained to serve as shelter belt and or wind break and further provide a milder microenvironment for the project site. Strict control on site clearing activities shall be implemented to minimize loss of vegetation and clearance shall be strictly limited to target vegetation. This impact is rated **moderate**. The application of Mitigation Measures will reduce the effects to a **minor** level.

## 6.13.6 Impact on Wildlife during Construction Phase

The potential impact on wildlife sources, rating criteria and mitigation measures are presented in Table 6.24.

| Impact           | Sources of Impact       | Mitigation Measures       | Impact on Wildlife during |

| to avoid excessive vegetation loss. |                             |                              |                        |              |
| Residual Impact                     |                             |                              |                        |              |
| Minor (Impact Rating = 28)          |                             |                              |                        |              |

## **Description of Impact**

Almost all the vegetal resources in the study area were reviewed to offer Provisioning Services. However, considering the relative amount of vegetal quantity that would be cleared and the sensitivity of the habitats and the threatened plant species, implementing the mitigation measures listed shall reduce these impacts to a negligible significance

## 6.13.7 Impact on Fisheries and Aquatic Resources

The potential impact on Fisheries and Aquatic Resources sources, rating criteria and mitigation measures are presented in Table 6.25.

| Impact        | Sources of Impact         | Mitigation Measures      | Impact on Fisheries |
|---------------|---------------------------|--------------------------|---------------------|

| Mitigation measures | · · · · · · · · · · · · · · · · · · ·        |

Situating plants nursery for seedlings development and subsequent propagation for bio-remediation and buffer stripping at some distance away from surface water, and away from the main and finger gullies. Also to ensure proper application of required fertilizers and other agricultural chemicals for the growing trees, grasses and shrubs in line with best agricultural practices and raising local stream bank buffers during construction until the planted trees, grasses and shrubs reach maturity stage.

#### **Residual Impact**

Moderate (Overall rating = 30)

## **Impact Description**

There is likelihood for high mortality of fish and other aquatic resources, due to water contamination and increased turbidity during construction. However, the measures recommended shall reduce the impact to a minimum level over short and long term.

## 6.13.8 Impacts on Community Health and Safety during Construction Phase

The potential impact on Community Health and Safety, sources, rating criteria and mitigation measures are presented in Tables 6.26.

## Table 6.26: Impacts on Community Health and Safety

#### Mitigation measures

- Develop a code of ethics for workers.
- All workers to receive training on community relations and code of conduct.
- Employ workers majorly from the host communities to do the unskilled jobs and where available
- Engage skilled labour from the local communities.
- Implement management practices aimed at eliminating disease vector breeding sites.
- Conduct safety and health advocacy on communicable diseases.
- Coordinate Stakeholder Engagement and implement Stakeholder Engagement Plan.
- Develop a health plan to address potential health issues;
- Initiate /enforce corporate health awareness programs for malaria, AIDS, etc.);
- Provide site medical personnel to attend to emergencies;

| Residual Impact  |                       |           |                |                |            |          |                |
| Moderate (Overall Impact Rating = 35)  |                       |           |                |                |            |          |                |
|  |                       |           |                |                |            |          |                |

There are potential impacts envisaged to arise from difference in social and cultural norms and values between the construction workforce and locals due to differences in belief systems. This may also lead to the violation of the existing traditional norms in the project area. These impacts are rated medium as the application of the mitigation measures shall reduce the impact to a **minor** level.

New diseases may be generated from project activities or heighten the existing vectors such as mosquitos, typhoid fever, influx of workers with no or partial immunity to malaria parasite, contraction of HIV/AIDS due unregulated sex behaviour of workers, contraction of Corona viral disease due to unprotected contacts between workers from different environments (especially Kano State is among States with high to moderate incidences Corona Virus infection, etc. The influx of workers into the project area also increases the risks of Sexually Transmitted Diseases (STDs) and could adversely impact the spread of HIV/AIDS. If left unmanaged, this impact may result in long-term health issues that may eventually lead to fatality. The impact arising from this is ranked as a medium. Application of the recommended mitigation measures can potentially reduce the impact to a **Minor level**.

## 6.13.9 Impacts on Social Infrastructure

Table 6.27 is an assessment of Socio-economic impacts on the existing social infrastructure of the project that is expected to occur during the construction phase.

| Impact Statement   | Sources of<br>Impact | Mitigation<br>Measures            | Impact on Socio-infrastructure     |  |  |  |
|--|----------------------|-----------------------------------|------------------------------------|--|--|--|
|  |                      | Integrated into<br>Project Design |                                    |  |  |  |
| Exertion of pressure   | An influx of         | Provision of ad-hoc               | Impact criteria Rating             |  |  |  |

## Table 6.27: Impacts on Socio-infrastructure

**Residual Impact** 

Moderate (Overall Impact Rating = 35)

## **Description Impact**

The recruitment and subsequent influx of labour force in the project environment, and demand for health care services in particular is expected. This is likely to exert pressure on the already limited social and particularly health services facilities in the area.

## 6.13.10 Project Impact on Security

Table 6.28 is an assessment of project impacts on security of persons and material.

| Impact Statement                                | Sources of        | Mitigation Measures  | Impact on accidents    | , kidnappings              |

#### Table 6.28 Impacts on security of men and materials

Establish secured store for project implements, materials and equipment and recruit well-trained security men from within the local community and/or engage the services of uniformed security guards to oversee security of stores. Proper enlightenment of staff especially non-indigenes on security tips, travel time especially on high ways, vigilance around the project environment. Ensure all workers have official identification tags of cards and routinely check infiltration of unauthorized persons in to project site.

#### **Residual Impact**

High Negative Impact (Overall Impact Rating = 60)

Security/safety challenges for men and materials during construction such theft of project equipment and materials, and fear of Kidnapping of non-indigene staff. Improper Storage of project equipment and material, exposer of staff to frequent high way travels etc. This impact is rated **High Negative**, and implementing the mitigation measures listed shall reduce the potential impact to **minor** level.

## 6.13.11 Impacts on Employment and Opportunities

The potential on the impact on employment and opportunities, sources, rating criteria and mitigation measures are presented in Tables 6.29.

| Impact Statement       | Sources of Impact   | Enhancement Measures      | Impact on the impact on      |
|------------------------|---------------------|---------------------------|------------------------------|
|                        |                     | Integrated into Project   | employment and opportunities |

| contract farming of   |  |  |  |  |
| and to be engaged in  |  |  |  |  |
| fruits bearing trees,   |  |  |  |  |
| of raising seedlings of   |  |  |  |  |
| horticultural business  |  |  |  |  |
| for locals to engage in   |  |  |  |  |

Based on the results of the socio-economic assessment, the unemployment rate in the area is high. The locals are, however, optimistic about the possibility of job availability with the project. Any available jobs opportunity will positively impact the employment and income situation at the study area. The effect is beneficial. Employment of casual un-skilled labour would occur for short-term contracts or the entire construction phase. This could result in a positive spin off during the construction phase as any level of employment in this region of moderate unemployment, and low wage levels will have a beneficial social spinoff. The impact is beneficial. During the construction phase, there will be provision for sub-contracting to local supplies. Supplies will include raw materials that meet standards as required for the construction of the facilities. Equal opportunities will be given to sub-contractors from the host communities. This is a positive impact and, as such, does not require mitigation.

## 6.13.12 Visual Impacts

The potential on Visual Impacts, sources, rating criteria and mitigation measures are presented in Table 6.30.

| Impact  | Sources of        | Mitigation Measures         | Impact on Visual Impacts |
|---|-------------------|-----------------------------|--------------------------|
| Statement   | Impact            | Integrated into Project     |                          |
|   |                   | Design                      |                          |
| Visual impact   | The presence of   | Maintain orderliness in the | Impact criteria Rating   |

|   |                   | waste                       | Severity 1               |
|   |                   |                             | Scale 3                  |
|   |                   |                             | Frequency 5              |
|   |                   |                             | Overall rating 35        |
|   |                   |                             | Impact Medium            |
|   |                   |                             | Significance             |
| Mitigation measures   |                   |                             |                          |
| Restore temporal work zones after construction              |                   |                             |                          |
| Maintain orderliness in the work area                       |                   |                             |                          |
| Proper handling (treatment and disposal) of generated waste |                   |                             |                          |
| Residual Impact   |                   |                             |                          |
| Minor   |                   |                             |                          |

Table 6.30: Assessment of Visual Impacts

Aesthetic impacts during the construction phase will be limited to work zones. The area already has many existing facilities; the changes in the landscape are not likely to produce significant impacts in most areas. These areas are not known to have unique landscape values. Setting up of these facilities may create visual intrusion by altering the typical landform pattern. Domestic waste might be disposed to the construction area, creating a visual nuisance. Construction waste will be disposed of at sites approved by relevant waste management. The duration of the construction activity is short term in nature, and the area's sensitivity is also medium. Thus the impact is rated **medium**.

## 6.13.13 Impact on Workplace Health Hazards and Safety

The summary of the potential impacts on workplace hazards and Safety, sources, rating criteria and mitigation measures are presented in Table 6.31.

| Nature Impact      | Sources of Impact   | Mitigation Measures           | Impact on Workplace Health |
|--------------------|---------------------|-------------------------------|----------------------------|
|                    |                     | Integrated into Project       | Hazards and Safety         |
|                    |                     | Design                        |                            |

## Table 6.31: Assessment of Impacts on Workplace Health Hazards and Safety

#### Mitigation measures

Develop project-specific health and safety procedures based international best engineering and safety practices including provisions for training to all categories of staff. Ensure periodic training of staff on workplace health and safety tips.

Provide and enforce the use of appropriate personal protective equipment (PPD), e.g. rubber hand gloves, hard hats, safety boots, etc. by all personnel at the project site

| Nature Impact  | Sources of Impact   | Mitigation     | Me        | easures     | Impact on Workplace Health          |  |
|--|---|----------------|-----------|-------------|-------------------------------------|--|
|  |   | Integrated     | into      | Project     | Hazards and Safety                  |  |
|  |   | Design         |           |             |                                     |  |
| Limit work activities  | to daytime only and   | ensure availa  | bility of | f first aid | facilities on all sites. Contract a |  |
| retainer clinic to be  | engaged and ensure  | e that site m  | nedical   | personne    | l are available at all work time.   |  |
| Provide an ambular   | nce for conveyance of   | f hazard affeo | cted sta  | aff for qui | ck medical attention. Maintain a    |  |
| medical emergency  | medical emergency response plan so that injured or ill persons can promptly access appropriate care |                |           |             |                                     |  |
| including adequate fuel supply for emergency vehicles at all times. Ensure all fuel storage tanks are kept |   |                |           |             |                                     |  |
| at safe distances from work areas. Ensure storage areas are identified with caution signs.                 |   |                |           |             |                                     |  |
| Residual Impact  |   |                |           |             |                                     |  |

#### High Negative (Overall Impact Rating = 60)

### **Description Potential Work Hazard Impact**

Hazards associated with the construction environment. Workers stand the risks of work place hazards during construction due construction work, careless handling of construction machines and equipment, natural hazards from such as snake bit and other biologically induced work place hazards.

## 6.14 Operation Phase Impacts and Mitigation Measures

The assessment of the potential impacts on air quality, sources, rating criteria and mitigation measures are presented in Table 6.25.

### 6.14.1 Impact on Ambient Air quality

The impact on ambient air quality is evaluated and presented in Table 6.32.

| Impact       | Sources of      | Mitigation Measures        | Impact on Ambient Noise |

|   | sites in the two  |                            |                          |         |  |
|   | pilot sub   |                            |                          |         |  |
|   | watersheds.   |                            |                          |         |  |
| Mitigation me   | asures  |                            |                          |         |  |
| There will be r   | o significant emission  | on during operation. Moven | nent of vehicles will be | minimal |  |
| while earth wo  | while earth work that may raise fugitive dust would remain at the minimum level. Restrict |                            |                          |         |  |
| movement of vehicles around the sites as much as possible |   |                            |                          |         |  |
| Residual Impact   |   |                            |                          |         |  |
| Minor (Overa  | Minor (Overall Impact rating = 21)  |                            |                          |         |  |

Reduction in Ambient Air Quality may be low. Fugitive dust produced by the movement of soils removed during construction phase, clearing, grading and back-filling, as well as emissions from internal combustion engines and other construction equipment can affect the ambient air quality

minimally. However this may be localized to specific construction sites in the two pilot sub watersheds.

## 6.14.2 Impact on Ambient Noise Level

The assessment of the potential impacts on Ambient Noise level, sources, rating criteria and mitigation measures are presented in Table 6.33.

| Impact   | Sources of   | Mitigation Measures        | Impact on Ambient Noise |  |  |
|--|--|----------------------------|-------------------------|--|--|
| Statement  | Impact   | Integrated into Project    | level                   |  |  |
|  |  | Design                     |                         |  |  |
| Increase in  | There will be no   | There will be no noise     | Impact criteria Rating  |  |  |

Table 6.33: Impacts on Ambient Noise Level

Minor (Overall Impact Rating = 12)

### **Description of Impact**

There will be no noise produced during the daily operation of gully bank treatment and bioremediation measures, and provision of buffer zones. Therefore, no significant increase in noise levels is envisaged.

## 6.14.3 Impact on Soil

The Assessment of the potential impacts on Soil, sources, rating criteria and mitigation measures are presented in Table 6.34.

| Impact Statement    | Sources of     | Mitigation Measures          | Impact on S     | oil during |
|---------------------|----------------|------------------------------|-----------------|------------|
|                     | Impact         | Integrated into Project      | Operation       |            |

### **Description of Impact**

Potential contamination of soil from accidental releases of hazardous or contaminating materials such as liquid fuel, solvents, and careless handling of agro-chemicals in the application on planted trees, grasses, and shrubs.

## 6.15 Impact on Socio-economy

The Assessment of the potential impacts on Socio-economy, sources, rating criteria and mitigation measures are presented in Table 6.35.

| Impact Statement   | Sources of   | Mitigation Measures            | Impact on       | Socio- |
|--------------------|--------------|--------------------------------|-----------------|--------|
|                    | Impact       | Integrated into Project        | economy         |        |
|                    |              | Design                         |                 |        |
| Socio-economic     | New          | The impact is beneficial and   | Impact criteria | Rating |

| Mitigation measures      |                  |                                  |                      |           |  |
| The impact is beneficial | l and shall be   | enhanced by sustaining the pro-  | oject through ade    | quate and |  |
| effective maintenance ac | tivities and cor | plying with the federal governme | nt's policies and la | ws on dam |  |
| operation.               |                  |                                  |                      |           |  |
| Residual Impact          |                  |                                  |                      |           |  |
|                          |                  |                                  |                      |           |  |
| Beneficial (Positive Imp | act does not     | equire scoring)                  |                      |           |  |

The intended improvement in the reservoir water quality and reduced sedimentation will impact positively on water users downstream, water pumping for domestic use to Kano and its environs, improvement in fish population and dam's functionality will result in the improvement of social services infrastructure in the area and a reduced cost of providing these services. Therefore the overall impact on the watershed management during operation and maintenance is beneficial to government and the general public.

## 6.15.1 Impact on Occupational Hazard and Safety

The Assessment of the potential impacts on Health, Safety and security, sources, rating criteria and mitigation measures are presented in Tables 6.36

| Impact Statement      | Sources of     | Mitigation Measures            | Impact on Occupational      |

|                     | and awareness-raising         |  |
|                     | among workers shall be put    |  |
|                     | in place.                     |  |
|                     | There will be regular         |  |
|                     | monitoring of potential       |  |
|                     | situations leading to         |  |
|                     | disaster.                     |  |
|                     |                               |  |
| Mitigation measures |                               |  |

Workers will be provided with all the required PPE. Worker enlightenment on operational safety issues shall be carried out regularly by Project Implementation and Monitoring Unit of HJKYB\_TF throughout. Toolbox talks shall be carried out regularly on safe work practices and other Operational Health Issues. First aid facilities shall be available in all work areas. Medical facilities shall be made available to all workers. Implementation of Emergency Response Plan and awareness-raising among workers shall be put in place. There will be regular monitoring of potential situations leading to disaster.

### **Residual Impact**

Moderate (Impact Rating = 45)

Occupational hazards and safety risks that may arise during the operation phase of the dam may arise from improper removal or incomplete evacuation of waste generated during the construction.

#### 6.15.2 Impact on Security of installations and Buffer Vegetation

The Assessment of the potential impacts on project installation and Vegetative Buffers Management, sources, rating criteria and mitigation measures are presented in Tables 6.37.

| Impact Statement    | Sources of          | Mitigation Measures           | Impact on Surface wa | ter quality |
|---------------------|---------------------|-------------------------------|----------------------|-------------|
|                     | Impact              | Integrated into Project       |                      |             |
|                     |                     | Design                        |                      |             |

#### **Description of Impact**

Planted economic trees and grasses as vegetative buffer including Avocado pears, improved mango species, improved oranges, as well as onions and vegetables mixed cropping around the reservoir. Local Community demand and crave for edible fruits and vegetables, foraging livestock, fishing, felling trees, destroying, vertiver grass for transplanting and managing soil erosion and gully formation on their farm lands, vertiver grass for animal feed, etc.

#### 6.16 Decommissioning Phase Impacts and Mitigation Measures

The decommissioning phase refers to all the activities related to the proposed watershed management project ends, i.e. when it terminates. During this phase, the demolition activities are likely to have similar impacts on the environment identified during the construction phase. These will include consequences such as rejuvenation of sedimentation, surface water pollution, visual impairment, air and noise pollution, risk of bush fires and safety and security of men, materials and project installations such as Gabions, Sediment traps, vegetative buffers etc. in this regard, impacts associated with the decommissioning exercise have been ranked on the bases of their significance index ranging from Low to Moderate.

Similarly, mitigation measures for impacts at the decommissioning stage will be implemented in accordance with subsisting practices at the time of decommissioning.

Consequently, the following mitigation measures have been suggested for issues arising from the decommissioning process:

- Contractor shall develop and implement a robust decommissioning plan in line with prevailing conditions and requirements at the time of decommissioning;
- Contractor shall ensure that excavated and stockpiled soil and vegetative material are removed and burned on the higher-lying areas and away from any runoff channels where it is likely to cause erosion or block the gullies to create any opportunity for flooding.
- Decommissioning activities should preferably occur during the dry season months to prevent soil erosion caused by heavy rains.
- All unprotected cleared areas and stockpiles shall be wetted with water to a reasonable degree of wetness to suppress any form of dust pollution. Institute noise control measures. All possible noise reduction protocols shall also be put in place during decommissioning activities.
- Take cognizance of peak traffic times and plan the transportation of decommissioned structures and personnel to avoid obstruction of local traffic by vehicles heavy machinery/trucks.
- It is necessary for the contractor to develop a decommissioning security plan and implement it to the latter.
- Ensure effective waste management from the start to the end of the decommissioning period.
- Enforce proper waste management policies in line with FMENV standards and requirements at the time of decommissioning.

Proper implementation of the above mitigation measures and those spelt out for construction impacts will reduce the impact to the **Barest Minimum** significance level.

## 6.17 Cumulative Impacts

## **Defining Cumulative Impacts**

Development of this watershed management project may be happing simultaneously with other developmental activities within and around the Challawa Watershed (project area). When taken together these simultaneous (mutually related or unrelated) projects or programs may generate impacts that will affect the same receptors/resources. Such impacts from all potential outcomes will become cumulative.

These impacts are regarded as cumulatively induced from impacts, on areas or resources used or directly impacted by the project, from other existing, planned or reasonably defined developments at the time the risks and impacts identification process is conducted. In general, cumulative Impacts are impacts that act with influences from other projects such that:

• The totality of the impacts is greater than their parts; or

• The sum of the effects attains a threshold level such that the impact becomes significant. The cumulative impacts that are considered to be relevant in the case of the CHallawa Gorge Dam Watershed Management include the following::

- Accumulative: the overall effect of different types of impacts at the same location. An example would be noise and water pollution effects of the Kano State government's proposed Hydro-electric power generating plant at the Challawa reservoir which has started, impacting the local communities as a nuisance/ disturbance and scaring wildlife from their natural harbitats.
- Interactive: where two different types of impacts (which may not singly be important) react with each other to create a new impact (that might be important) (e.g. water abstraction from a watercourse might exacerbate the consequences caused by increased sediment loading).
- Additive or In-combination: where impacts from the primary activity (i.e. the construction and operation of the Project) are added to impacts from third-party activities, e.g. An example would be noise and water pollution effects of the Kano State government's proposed Hydro-electric power generating plant at the Challawa reservoir which has started, impacting the local communities as a nuisance/ disturbance and scaring wildlife from their natural habitats in addition to the already identified effects of the Challawa Gorge Dam Watershed Mangement Project.

#### 6.18 Identification of Relevant Development(s)

The cumulative impact assessment focuses on the combined effects of the Project with potential future development in the immediate area around the Project site. The cumulative assessment impacts the potential project in view, depending on the status of other projects and the level of data available to characterize the magnitude of the impacts.

Given the lack of available information regarding such future developments, this assessment follows a generic pattern. It focuses on critical issues and sensitivities for this project and how these might be influenced by cumulative impacts with a combination of other developments. Consultations with local and state authorities and identification of relevant and significant developments via searches of relevant documents provided invaluable assistant in this assessment. The main developments identified are cumulative impacts from other projects within 2km.

#### **CHAPTER SEVEN**

#### ENVIRONMENTAL AND SOCIAL MANAGEMENT PLAN

#### 7.1 Introduction

An Environmental and Social Management Plan (ESMP) is an important component of an Environmental and Social Impact Assessment (ESIA) as it provides an important tool that can be used to measure and check, in a continuous manner, the efficacy of the mitigation measures and project commitments incorporated in the ESIA to minimize or eliminate identified negative impacts. In addition, the ESMP may also be used to ensure compliance with statutory requirements, and corporate safety & environmental and social management policies.

The key features of an ESMP, drawing from relevant existing guidelines as well as the Nigerian ESMP guidelines, is that it is applicable to a range of types and scales of projects or developments, from projects with a low level of environmental risk to those with high environmental risk; assumes a broad understanding of the term "environment", that includes the biophysical, social and economic components; includes the enhancement of positive impacts (benefits) as well as the mitigation of negative impacts; and should not be viewed as a prescriptive and inflexible document.

An ESMP is therefore, a tool which ensures continuous assessment of the environmental and social impact of a project operation as well as proactive response to the impacts to reduce their overall effect on the identified environmental parameters. It makes an organization to do the right thing at the right time rather than responding to situations borne out of statutory or legal compulsion. This essential tool is contained in the International Standards Organization (ISO).

In this section, an ESMP is presented to be used throughout the life span of the proposed project in Challawa Gorge Dam, Kano State. This ESMP will facilitate environmental and social management of the proposed project and procedures that are provided to help prevent, avoid or minimize negative environmental impacts that may occur from the project planning phase through construction and operations.

#### **Objectives of the ESMP**

The ESMP is needed to successfully manage the project's environmental and social performance throughout its lifecycle. It integrates social and ecological management with overall project engineering, procurement, construction, and operations. The ESMP is prepared to achieve the following objectives:

### 7.2 Objectives of Environmental and Social Management Plan (ESMP)

The objectives of ESMP for the proposed project are to:

- x. Monitor the project proponent's compliance with all the mitigation measures and commitments in the ESIA report;
- xi. Provide early warning signals on potential environmental changes, so that appropriate actions can be taken to prevent or minimize environmental and social impacts;
- xii. Put in place a sound and cost-effective contingency plan that can be activated for prompt response to any unforeseen occurrence;
- xiii. promote environmental and social control in the project implementation in all phases;
- xiv. Ensure that all relevant stakeholders are well informed about their individual and collective responsibilities;
- xv. Incorporate environmental and social management into the project design and implementation processes;
- xvi. Serve as a proxy action plan for social and ecological management for the project;
- xvii. Provide a framework for implementing environmental and social commitments (such as mitigation measures identified in the ESIA);
- xviii. Prepare and maintain project ecological and social performance records for monitoring and evaluating performance monitoring, audits and non-compliance tracking.

The essence of the ESMP is to encourage and achieve the highest environmental and socioeconomic performance standards, and routinely monitor project functions and activities.

#### 7.3 Institutional Framework for Implementation of the ESMP

Responsibilities in implementing and monitoring the ESMP are shared between multiple stakeholders, including regulatory and concerned agencies, the AfDB-PIU, the proponent and the contractors.

The key roles and responsibilities for the implementation of the ESMP are presented. Overall:

The Kano State Ministry of Environment will have principal responsibility for all measures outlined in the ESMP for the construction phase.

The Ministry is responsible for the implementation of the measures in the operation phase.

Both may delegate responsibility to their contractors, where appropriate. In cases where other individuals or organisations have responsibility for mitigation or enhancement measures, this is indicated in Tables 7.2 and 7.3.

Capacity building and training requirements are also described, where these relate to specific skills required to deliver the ESMP action in question.

## The Project Implementation Unit (PIU) will manage the project.

The PIU shall hire and manage contractors; a witness NGO shall be accredited to monitor and evaluate the implementation of the ESMP to a certain extent. The contractors are responsible for the performance of the ESMP. Overall regulatory agencies at the National, State and Local Government levels are accountable for implementing ESMP.

## 7.3.1 Project Proponent (HJKYB-TF)

The project proponent is the Hadejia Jama'are Komadugu Yobe Basin Trust Fund. Six riparian States established the body in collaboration with Federal Government in Damaturu in 2006. The Trust Fund is an regional platform for a joint intervention with the support of the Federal Government of Nigeria for augmenting line agencies in addressing land and water resources issues in the KYB.

An Executive Secretary heads the HJKYB-TF. A PIU has been constituted with a Project Manager who reports to the Executive Secretary.

#### 7.3.2 Project Implementation Unit (PIU)

The PIU set up by the HJKYB-TF-AfDB is saddled with the responsibility of project implementation. A Project Manager heads it. Members of the PIU consist of technical experts and environmental, social, and two liaison officers appointed from the Federal and Kano State Ministries of Water Resources.

PIU is responsible for the overall project planning and execution, including preparing bidding documents, hiring project management consultants, EPC contractors, and supervising the works. This approach includes ensuring proper implementation of the environmental and social management measures contained in the ESMP and monitoring. To provide additional oversight, the project PIU will retain the services of the ESIA Consultant to manage the ESMP implementation. The PIU will also invite relevant NGOs to monitor and ensure the adequate performance of the ESMP.

## 7.3.3 The Ministry's HSE Department

The HSE department shall be responsible for ensuring the implementation of management measures during the operation phase (post-commissioning), including audits, compliance monitoring, and preparation of periodic reports required by regulations to the operations.

## 7.3.4 Regulatory Agencies and Other Concerned Authorities

The Federal Ministry of Environment (FMEnv) is responsible for implementing the EIA Act 86 of 1992. Furthermore, the proponent and the affected LGA have specific oversight roles, which they perform under the coordination of the FMEnv. Responsibilities for the ESIA and its implementation are shared between multiple stakeholders, including Ministries of Water Resources (Federal and State) competent authorities, the project implementation unit (PIU), the proponent and the contractors as presented (Table 7.1).

\*The Bank= AfDB

The responsibilities and roles for each of the institutions are discussed below.

## The Federal Government of Nigeria

The Federal Ministry of Environment is responsible for the overall environmental policy of the Country. It has the responsibility for ESIA implementation and approval under the EIA Act. It has developed specific guidelines and regulations to protect the environment and promote sustainable development. It will monitor the implementation of mitigation measures when the project commences. And they can issue directives to the project on specific actions related to the environment in the project area. The Ministry involves the States typically and sometimes local governments in this responsibility depending on the particular activity.

#### Kano State Ministry of Water Resources and Environment

The Environment department of the ministry manages both human and industrial waste, protects and conserves the environment, and enforces laws on the environment in the State.

#### **Project Proponent**

HJKYB-TF has the overall management for implementing the Challawa Gorge Dam project. However, the body has delegated the daily implementation operations to the PIU.

#### **Project Implementation Unit**

It is a unit established by the proponent responsible for delivering the project, including planning, feasibility, ESIA, engineering, procurement and construction (EPC). Furthermore, the PIU shall ensure:

\*Proper implementation of the ESMP

\*Implementation of stakeholder's-approved projects financed through the EPC contractors.

\*Production of monitoring reports to appropriate government authorities, Ministry and the contractor in charge of the project.

#### Kano State Environmental Protection Agency

The agencies are responsible for preparing and updating periodic master plans for the development of environmental science and technology and advise the government of the financial and material required for the implementation of such programs; to establish a mechanism to predict ecological disasters; identify the problems of drainage and sewage systems and carry out measures to improve, protect and remedy their ecosystems, also protection and development of the environment and also ensuring a healthy environment.

#### Kano State Ministry of Transport (KnSMT)

The significant roles of the Ministry are;

\*To formulate and implement effective policies regarding road transportation to ensure that adequate road safety measures are implemented across the State.

\*To coordinate the creation of transportation parks, identification and development of railways and river transportation.

\*To ensure effective and efficient movement of goods and services that will enhance socioeconomic growth throughout the States.

#### Kano State Ministry of Land Survey Housing and Urban Planning (KNSMLSHUP)

The Ministry is vested with the authority of land administration. They are also charged with the survey of state lands, determination of land use and control, compensations, housing policies and urban development. The Ministry is also responsible for the supervision of the PIU, mapping and surveying, registration of title to lands, development and maintenance of open spaces.

#### Local Government Areas (LGAs)

The affected LGAs are involved in the ESIA approval process. According to the national EIA requirement, the LGAs will have representatives in the panel that will review the report and advise the Minister to make decisions on the project.

#### **The Customary District Councils**

The traditional head of Karaye Emirate has an essential role in the project concerning mobilising the community members to support the project, grievance redress, peace and security of personnel, equipment, and facilities to be installed. Close contact and regular consultation shall be maintained with customary chiefs throughout the life of the project.

#### Witness NGO

To enhance transparency and trust from PACs, it is suggested that a witness NGO, recognised and credible in the project area, be retained, through a public proposal and selection process, to provide independent advice, and report on ESMP implementation and management, focusing on consultation activities, corporate social responsibilities/related activities and grievances management. This NGO could be a recognised and credible Human Rights advocacy group or an NGO active in rural, environmental, social or development.

This outside look will ensure that proper procedure and stated ESMP processes are followed, that PACs grievances are well taken care of, and that PACs are treated with fairness. This model of supervision is consistent with best practices nationally and internationally. It will ensure that the process is fair and equitable with net positive benefits for the PACs. It also minimises grievances.

#### **Contractor Environmental Manager**

Each contractor shall appoint a qualified environmental manager who, after approval by the PIU, will be responsible for daily management onsite and the respect of management measures from the ESMP. This manager will regularly report to the environment and social expert of the PIU during the entire construction period. Contractors must hold all necessary licenses and permits before the work begins. It will occur to provide to the PIU all of the required legal documents, among which the signed agreements with owners, authorisations for borrow pits and temporary storage sites, etc.

#### **Communities (Community Liaison Officers)**

Leaders and traditional institutions of the affected communities will assist in public sensitisation efforts to advance the implementation of ESMP.

### 7.4 Communication

After the transfer of operation, the state government will maintain a formal communication procedure with the regulatory authorities and communities. The E & S Manager in the PIU is responsible for transmitting HSE issues to and from regulatory authorities whenever required. Meetings will be held, as needed, between the state government and the appropriate regulatory agency and community representatives to review ESMP implementation, health and safety issues and community relationships during implementation performance, areas of concern and emerging issues. Dealings will be transparent, and stakeholders will have access to personnel and information to address concerns raised.

The Project will develop and implement a grievance mechanism whereby community members can raise any issues of concern. Grievances may be verbal or written and usually either specific claims for damages/injury or complaints or suggestions about how the Project is being implemented. When a grievance has been brought to the Project team's attention, it will be logged and evaluated. The person or group with the grievance must present grounds for making a complaint or claiming loss to make a proper and informed evaluation.

Where a complaint or claim is considered valid, steps are required to be undertaken to rectify the issue or agree on compensation for the loss. In all cases, the decision made and the reason for the decision will be communicated to the relevant stakeholders and recorded. Where there remains disagreement on the outcome, an arbitration proceeding may be required to be overseen by a third party (e.g. government official). Local community stakeholders will be informed on how to implement the grievance procedures.

### 7.5 Documentation

The proponent for the operation phase will control HSE documentation, including management plans, associated procedures, checklists, forms, and reports. All records will be kept onsite and backed up at several off-site locations (including secure cloud storage facilities). Records will be held in both hard copy and soft copy formats. And all documents will be archived for the life of the project.

Furthermore, the document control procedure by the Ministry will describe the processes that the Project will employ for official communication of both hardcopy and electronic (through the internet) document deliverables. In addition, it will explain the requirement for electronic filing and posting and the assignment of document tracking and control numbers (including revision codes).

The E & S Manager of PIU is responsible for maintaining a master list of applicable HSE documents and ensuring that this list is communicated to the appropriate parties. The HSE Coordinator is responsible for providing notice to the affected parties of changes or revisions to documents, issuing revised copies, and checking that the information is communicated within that party's organisation appropriately.

The subcontractors will be required to develop a system for maintaining and controlling its HSE documentation and describe these systems in their respective HSE plans.

## 7.6 Operational Control Procedures

Each significant impact identified in the ESIA will have an operational control associated with it that specifies appropriate procedures, work instructions, best management practices, roles, responsibilities, authorities, monitoring, measurement, and record-keeping to avoid or reduce impacts. Operational controls are regularly monitored for compliance and effectiveness through a monitoring and auditing procedure described in the ESMP.

Operational control procedures will be reviewed and, where appropriate, amended to include instructions for planning and minimising impacts or reference relevant documents that address impact avoidance and mitigation.

## 7.6.1 Managing Changes to Project Activities

Changes in the Project may occur due to unanticipated situations. Adaptive changes may also occur during the final design, commissioning or even operations. The Challawa gorge dam management will implement a formal procedure to manage changes in the project that will apply to all project activities.

The procedure's objective is to ensure that the impact of changes on the health and safety of personnel, the environment, plant and shared equipment are identified and assessed before changes are being implemented. The management of change procedure will ensure that:

- proposed changes have a sound technical, safety, environmental, and commercial justification;
- Changes are reviewed by competent personnel, and the impact of changes is reflected in documentation, including operating procedures and drawings;
- hazards resulting from changes that alter the conditions assessed in the ESIA have been identified and evaluated, and the impact(s) of changes do not adversely affect the management of health, safety or the environment;
- changes are communicated to personnel who are provided with the necessary skills, via training, to implement changes effectively; and
- the appropriate proponent official (s) accepts the responsibility for the change.

As information regarding the uncertainties becomes available, the Project ESMP will be updated to include that information in subsequent revisions. Environmental and social, and engineering feasibility and cost considerations will be considered when choosing between possible alternatives.

## 7.6.2 Emergency Preparedness and Response

The proponent will prepare plans and procedures to identify the potential for and respond to environmental accidents and health and safety emergencies and prevent and mitigate potentially adverse ecological and social impacts that may be associated with them. The Ministry will review emergency preparedness and response daily and after any accidents or emergencies to ensure that lessons learnt to inform continuous improvement. Emergency exercises will be undertaken regularly to confirm the adequacy of response strategies. Investigations of accidents or incidents will follow formal documented procedures.

### 7.6.3 Checking and Corrective Actions

Checking includes inspections and monitoring and audit activities to confirm the proper implementation of checking systems and the effectiveness of mitigations. Corrective actions include response to out-of-control situations, non-compliances, and non-conformances. Measures also include those intended to improve performance.

### 7.6.4 Monitoring

Monitoring will be conducted to ensure compliance with regulatory requirements and evaluate the effectiveness of operational controls and other measures intended to mitigate potential impacts. Monitoring parameters are included in the ESMP Tables 7.2 and 7.3.

Monitoring methodologies or processes must be put in place to ensure the efficacy of the mitigation measures identified in the ESIA. Monitoring methodologies should be established to address the following:

- Alteration to the biological, chemical, physical, social and health characteristics of the recipient environment;
- Alterations in the interactions between project activities and environmental and social sensitivities, and interactions among the various sensitivities;
- Monitor the effectiveness of the mitigation and enhancement measures;
- Determination of long term and residual effects;
- Identification of Project-specific cumulative environmental and social effects, if applicable;
- The quarterly FMEnv monitoring shall be performed with the involvement of the communities. This joint monitoring will support good community relations by creating trust and involvement;
- At the construction site, inspections should be performed on human resources procedures, occupational health, safety and security risks management, emergency planning and the open water on malaria larvae; and

 The recruitment, human resources procedures, HSE training and awareness of the labour force in the construction as well as the operation phase should be monitored to know their origin in line with the local content plan and the level of knowledge and awareness on the code of conduct, STD prevention and occupational H&S measures.

The FMEnv guidelines require an environmental monitoring plan as part of an ESIA. The monitoring program aims to ensure that the negative environmental and social impacts identified in this ESIA are effectively mitigated in the construction and operation stages of the Project.

## 7.6.5 Auditing

Beyond the regular inspection and monitoring activities conducted, audits will be carried out by the state ministry to ensure compliance with regulatory requirements as well as their HSE standards and policies. Audits to be conducted will also cover the subcontractor self-reported monitoring and inspection activities. The audit shall be performed by qualified staff, and the results shall be reported to the state ministry of environment to be addressed.

The audit will include a review of compliance with the requirements of the ESIA and ESMP and have, at a minimum, the following:

- completeness of HSE documentation, including planning documents and inspection records;
- conformance with monitoring requirements;
- efficacy of activities to address any non-conformance with monitoring requirements; and
- training activities and record keeping.

There will be a cycle of audits into specific areas of the Project. The frequency of audits will be risk-based and will vary with the Project stage and depend on previous audits' results. A regulatory compliance audit is a mandatory requirement to be carried out by an independent accredited consultant every three years during the operation phase and the reports submitted to the Federal Ministry of Environment.

## 7.6.6 Corrective Action

Investigating a 'near-miss or actual incident after it can be used to obtain valuable lessons and information that can be used to prevent similar or more severe occurrences in the future.

The proponent will implement a formal non-compliance and corrective action tracking procedure to investigate the causes and identify corrective actions to accidents or environmental or social non-compliances. This will ensure coordinated action from EPC Contractor and its subcontractors. The HSE coordinator will be responsible for keeping records of corrective actions and overseeing the modification of environmental or social protection procedures or training programs to avoid the repetition of non-conformances and non-compliances.

## 7.6.7 Reporting

Throughout the project, the proponent will keep the regulatory authorities informed of the Project performance concerning HSE matters by way of written status reports and face-to-face meetings. They will prepare a report on environmental and social performance and submit it to FMEnv. The frequency of this reporting will be determined by FMEnv, in a letter of approval of the project. These reports are prepared as part of the requirements for impact mitigation monitoring carried out by FMEnv.

If required, the proponent will provide appropriate HSE-related activities, including internal inspection records, training records, and reports to the relevant authorities. Subcontractors are also required to provide HSE performance reporting to the proponent regularly through weekly and monthly reports. These will be used as inputs to the above.

## 7.7 Grievance Mechanisms

During the implementation of the ESMP, disputes/disagreements between the project developer and the PACs may occur. There are significant challenges associated with grievance redress, especially in projects of this magnitude. A grievance procedure based on community grievance resolution channels and regulatory agencies shall be used.

## 7.7.1 Customary Mediation

All the communities affected by this project have internal mechanisms for resolving disputes through the customary chiefdoms. Such customary avenues should provide a first culturally appropriate grievance procedure to facilitate formal or informal grievance resolution.

The PIU shall set up a Customary Grievance Redress Committee in each community to address complaints. PAPs' complaints should first be lodged verbally or written in the grievance register through the customary chief, who in turn will invite the PIU. The PIU and the traditional leaders, and other Councils Chiefs will try to resolve the issue amicably. If the complaint cannot be

resolved at this level or the plaintiff is not satisfied with the settlement proposed, the matter should be reported to the regulatory agencies.

### 7.7.2 Regulatory Agencies

FMEnv and the Kano State Ministry of Environment have the statutory responsibility for oversight and monitoring the implementation of the ESMP. The agencies shall pronounce judgment on any environmental complaint or dispute reported to them based on regulatory requirements. At this stage, if the plaintiff is still not satisfied with the settlement, they can then proceed to the official legal procedures.

## 7.7.3 Courts of Law

The judicial process under applicable laws will be followed, and the law courts will pass binding judgment on the matter.

# 7.7.4 Grievance Resolution Procedures

The first level is the Village Chief and the PIU: The aggrieved person shall first report the matter to the Village Chief for resolution. Issues that can be resolved at this level include community quota, boundary issues, etc. The type of issues to report to the PIU for possible adjudication have perceived damage to property or means of livelihood, incorrect PAP data, infidelity to ESMP and corporate social responsibilities, etc. If the issue is not resolved at this stage, it can then be escalated to customary mediation. If still no acceptable resolution is achieved, the parties may choose to go to the regulatory agencies and, after that, to the court under the laws of the Federal Republic of Nigeria. Figure 7.2 illustrates the procedure for grievance resolution.

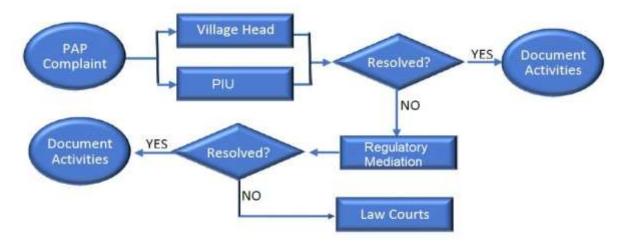

Figure 7.2: Grievance Resolution Procedures (Adopted from Jama'are River Regulation ESIA Report, 2021)

#### 7.8 Proposed Management Plan

The Environmental and Social mitigation/enhancement measures and the responsibilities for implementation are in Tables 7.2&7.3. The EPC contractor has the responsibility for implementing the mitigation actions during the construction phase. The budget for implementation shall be included in the EPC contract as part of the overall construction cost.

The monitoring plan in Tables 7.4 and 7.5 contains details of responsibilities, parameters to be monitored, monitoring methods and standards/targets, and locations and monitoring frequency. The cost estimates cover costs of analyses of samples (where required), travelling expenses and regulatory costs. The budget for environmental and social monitoring during construction (Table 7.4) shall be added to the EPC contract budget. The EPC Contractor shall be required to disburse when needed, as may be directed by the Project Manager.

The budget for the monitoring during operations shall be provided by the Ministry's management in its annual budgeting process and administered directly by the appropriate authorities responsible for ensuring mitigation actions are implemented effectively. The Ministry shall adopt these measures and impose contractual conditions during the operation phase of the project. Additional detailed policies and specific plans have been developed to support the implementation.

## Chapter Eight Conclusion and Recommendations

### 8.1 Summary and Conclusion

This Environmental and Social Impact Assessment (ESIA) Report was prepared in accordance with the requirements of the Federal Ministry of Environment and the African Development Bank (AfDB). Based on interactions between project activities and the recipient environment, the ESIP/ESMP is well documented in this report.

The proposed Challawa Gorge Dam Watershed Management Project by the HJKYB\_TF is justifiable and will have a number of significant positive effects in the short and long term including:

- Reduce Environmental Pollution;
- Minimize global warming and climate change;
- Ensure minimum or no siltation of the Challawa Dam Reservoir which will boost agricultural, commercial, uninterrupted Kano Municipal water supply for domestic and industrial use in the area;
- Stabilize soils and control the menace of gully formation and farm lands destruction around the river banks in the area;
- Contribute to national water resources development and management; and
- Create employment opportunities for the people of the area.

The overall impacts associated with the activities of the proposed project can demonstrably be managed within reasonable and acceptable limits by applying all the recommended mitigation measures.

In addition to the identified mitigation measures, there are a number of other commitments to be followed. These include:

- Undertaking a Best Practicable Environmental Option (BPEO) for the watershed management;
- Define and undertake monitoring for atmospheric emissions, soil loss, sediment influx and social impacts;
- Regular auditing of environmental performance of the project operational elements;
- Carry out further studies to determine the best decommissioning strategy towards the end of the project lifecycle; and

An Environmental and Social Management Plan (ESMP) has also been drawn up to manage residual impacts, ensure compliance with regulatory requirements and the incorporation of environmental controls throughout the project life cycle.

#### 8.2 Recommendation

In view of all that had been documented in this ESIA/ESMP report and the commitment by HJKYB-TF to ensure strict compliance with this EIA, the Hadeja-Jamaare-Komadugu-Yobe Basin Trust Fund hereby requests the endorsement of the AfDB and the National Regulatory body (FMEnv.) for Approval to enable timely commencement of the proposed project.

Attention: Dr. M. Bakia

#### AUTHORITY TO DISCLOSE

#### ENVIRONMENTAL AND SOCIAL IMPACT ASSESSMENT (ESIA) OF CHALLAWA GORGE WATERSHED MANAGEMENT PROJECT

I am directed to inform you that Hadejia Jama'are Komadugo Yobe Basin Trust Fund has registered the above-mentioned project with the Federal Ministry of Environment for an EIA permit.

 The ESIA process is on-going, the draft ESIA Report has been submitted and shall soon be displayed for stakeholder's comments. You are kindly requested by this to proceed with your internal disclosure controls and to give the project all necessary assistance.

 Please note that the Federal Ministry of Environment shall ensure that the Approval process leading to ESIA certification and monitoring is concluded.

Thank you for your cooperation.

Dr. Abbas. O. Suleiman, nas Director, Environmental Assessment Department For: Honourable Minister.

#### COMMUNIQUE ISSUED AT THE END OF A ONE DAY WORKSHOP FOR UPDATING HJKYB STAKEHOLDERS ORGANIZED BY THE HADEJIA JAMA'ARE KOMADUGU YOBE BASIN TRUST FUND HELD ON THURSDAY 1<sup>ST</sup> JULY 2021 AT BAUCHI STATE AGRICULTURAL DEVELOPMENT PROGRAMME, MTRM CONFERENCE HALL, BAUCHI, BAUCHI STATE.

#### 1.0 **PRESENTATIONS**

After a brief on the project and the thrust of the workshop presented by the Executive Secretary of the HJKYB Trust Fund, Prof. Hassan Haruna Bdliya, the following discussions came up

#### DISCUSSIONS

The following issues that emanated from the presentations were discussed, elaborated and clarified:

- > What can we do about the Fisheries priority project?
- > What do we do after the appraisal?
- What can we do about the BoT?
- > What can we do about the passage of the Water Resources Bill?
- How do we re-invigorate the IWRMC?

#### 2.0 RESOLUTIONS

The Workshop Resolved as follows:

- > The problems of KYB-WDI is the problem of all stakeholders
- Stakeholders and the TF should exploit political linkages to re-submit the fisheries project for possible funding
- The TF should follow AfDB standard procedure of engaging contractors/consultants and enquire about project implementation manual
- The TF should write to the Hon. Minister of Water Resources informing him of the expiration of BoT's tenure, subsequently the Minister in his capacity writes to the Governors of the riparian State
- The TF should support and encourage the Hon. Minister in sensitization campaign to enhance the passage of the Water Resources Bill
- SIWRMCs would be assisted by TF to reach out to their respective Commissioners of Water Resources and establish a define line of budget and desk officer

#### > <u>CONCLUSIONS</u>

> The workshop was adjudged to be successful, while stakeholders look forward to the implementation of the resolutions.

# RECORD OF CONSULTATION MEETINGS WITH PRIMARY AND SECONDARY STAKEHOLDERS

#### MINUTES OF ESIA STAKEHOLDERS' INTERACTIVE CONSULTATION WORKSHOP HELD AT THE CHALLAWA GORGE DAM MANAGEMENT OFFICE

The interaction started by 12:14 pm with an opening prayer by the Village head of Turawa, followed by self-introduction of all participants. The Consultant in Person of Prof. Abbas Bashir presented an Opening remark stating the purpose of the visit and what is expected of all participants in the event. The representative of the Federal Ministry of Environment Hajiya Sikirat further stressed the need for the project, she stressed the need for water shed management in order to sustain the Dam that supports the livelihood of the dependent community. She stressed the various techniques and methods that can be applied in addressing the issues identified. She further stressed that the purpose of the visit was to combine two very important activities that's scooping and site identification, they are important things been done in any ESIA or EIA activity. She raised some questions to the consultant for clarification. She further stressed the need for following all detailed aspects of the exercise to its logical conclusion.

The representatives of Kano State Ministries of Water Resources, Environment and Agriculture, gave their brief remarks on the purpose of the meeting. The Director of Environment in the Kano State Ministry of Environment further stressed on some of the important activities in relation to the eChallawa Gorge Dam and stressed the need for tree planting as a way of controlling erosion that affects the environment and the general livelihood of the inhabitants of the dam area. He emphasized on the need for community leaders to discourage their followers from cutting down trees through the process of deforestation which would negatively affect the environment. The director stressed the need for their response regarding the intending exercise.

The Project Manager, Challawa Gorge Dam, Mal. Ibrahim Zarewa once again welcome participants to the project office, the venue of the workshop. He then gave a brief background of the dam, he said Challawa Gorge Dam design and construction was started by Water Resources Engineering and Construction

Agency (WRECA). The contract was revoked and re-awarded to Julius Berger in 1989 and they completed in 20th July, 1992 and commissioned by former Nigerian Military Head of State, President Ibrahim Badamasi Babangida. The purpose of the dam is to store water under mandatory releases for irrigation to both Kano River Irrigation Project (KRIP) and Hadejia Valley Irrigation Project (HVIP). The water flows up to Lake Chad. The dam has a storage capacity of 930 million cubic meters. The dam has an area of about 100KM2 with a length of about 7.8Km long including the embankment.

Another purpose of the dam is to control flooding around the downstream communities. The dam attains its maximum storage capacity by the second week of August and start flowing to the downstream through the spillway. During the dam construction, some settlements were resettled and some disperse small villages were also brought together and resettled together and provided with all basic amenities like electricity, water supply, hospitals, schools, viewing centers among other basic needs of life. Many informal irrigation is ongoing within and around the dam site that has contributed to siltation of the dam.

The Community Leader of Turawa welcomed all participant to community and equally shows his delight with the crop of people participating in such exercise recalling that in those day, such activities were mostly carried out by expatriates (Turawa). He further advised the team to extend a letter formally to the district heads of Rogo, Karaye an Kiru being their superior traditional leaders within the area of the consultant's assignment. He stressed the need for proper management of the Challawa gorge dam as it boosts livelihood economic activities of the community.

The Community Leader of Sakarma also commended the effort of the Government for initiating such an important exercise that would address the problem of erosion that leads to the siltation of the Challawa dam, he further stated that most of the affected areas are within his domain assured the consultant that he's fully in support of the exercise.

Sarkin Noma also contributed his own by expressing his delight and satisfaction over the irrigation farming being practiced in the community as a result of construction of the dam. He stated that the dam was an integral aspect of their life, when the plan for construction of the dam was conceived, the community were against it entirely thinking that it would take away their source of livelihood completely. The representative of the herdsmen, Yakubu Musa Ardo and that of the fishermen also made their contributions by stating the need for the intended project in order to halt the deterioration of the dam that supports their main source of livelihood.
